

CENSUS OF THE N.-W. PROVINCES, 1872.

VOL. I.

GENERAL REPORT,

AND

STATEMENTS AND TABLES:

SHOWING DETAILS OF

AREA AND POPULATION:

EXHIBITING

POPULATION ACCORDING TO AGE AND EDUCATION, AND WITH
REFERENCE TO LAND, LAND REVENUE, NATIONALITIES,
CASTES, TRIBES, AND OCCUPATIONS:

AND GIVING ALSO

A CLASSIFIED LIST OF VILLAGES AND TOWNS,

AND

APPENDICES A. TO G.

COMPILED BY

W. C. PLOWDEN, F.S.S.,

BENGAL CIVIL SERVICE.

Published by Authority.

ALLAHABAD:

PRINTED AT THE NORTH-WESTERN PROVINCES' GOVERNMENT PRESS.

1873.

FROM

THE SECRETARY TO GOVERNMENT,

North-Western Provinces,

TO

THE SECRETARY TO GOVERNMENT OF INDIA,

Home Department.

DATED ALLAHABAD, THE 23RD JANUARY, 1874.

SIR,

I AM directed to forward, for submission to His Excellency the Governor-General in Council, a copy of Mr. Plowden's report on the Census of the North-Western Provinces, with its Statistics and Appendices.

2. The Lieutenant-Governor considers that this report is one of unusual value and interest. Mr. Plowden has treated all the subjects on which light is thrown by the present figures in a way which, so far as the materials sufficed, is at once suggestive and exhaustive; and where his own information (which on statistical subjects is unrivalled in the North-Western Provinces) stopped, has obtained assistance from other persons qualified to give an opinion. It is impossible in this letter to review fully the questions raised in the report, both on account of the intricacy in which they are involved and of the length to which such a review would run. His Honor desires only to indicate the main points to which attention should be directed.

3. The Census was taken on the night of the 18th January, 1872, the moon being then eight days old and supplying light till midnight. The full moon would have been chosen but for the fact that the great fair at Allahabad would then have been at its height, involving a considerable disturbance in the natural distribution of the population. As was the case in 1865, the enumerators had been trained in the work since November, and their returns had been tested and retested, and all that was done on the night of the Census was to correct them by recording the people actually present in each house on that night. From these returns abstracts were drawn up in the Collector's offices, which were sent to Mr. Plowden to compile his tables from; and thus an opportunity was given for clearing on the spot difficulties arising from errors in writing and spelling which the Central Office could not have corrected. Mr. Plowden states that "There is a general consensus of opinion on the part of district officers that the present Census, as a mere numbering of the people, is as accurate as we can hope to make it with the agency available." The Lieutenant-Governor's own experience, and the impression he has derived from the officers of whom he has made enquiries, confirm this view.

4. The population of the North-Western Provinces was returned in 1865 at 29,684,347, exclusive of Ajmere; since then some portions of Shahjehanpore and Jhansie have been transferred to ~~O~~ the State

to the conclusion that the disparity is mainly due to the wide prevalence of the practice of female infanticide, including in that word not merely active deprivation of life but also neglect and disregard in the rearing of girls. The conclusions thus arrived at are worked out by a laborious chain of argument, and they form an undoubted and urgent call on Government not to relax in the efforts which have been made to put down the crime.

9. The attempt to classify the different ages of the population had never been made before in this or any other province of India, and no doubt there is a considerable element of error in the returns, due to inaccurate replies and to the ignorance of the parents; but Mr. Plowden is of opinion that the classification is on the whole successful and correct. In 1865 the enumeration showed children under 12 years old to be 35.6 per cent. of the entire population; the present Census (which, by demanding the details of age forced the parents to reply with some consideration, is probably more accurate) returns them as 33.19 per cent. The report establishes with care and force the conclusions to be drawn from this large proportion as to the high rate of mortality which prevails in the North-Western Provinces. Something must be set down to infanticide and neglect of infant life, something possibly to the concealment of girls, or some other reason which makes the numbers of females between 10 and 15 years to fall off sensibly; but the main cause of the disproportion is undoubtedly "the high birth-rate, with a higher rate of mortality and a lower average duration of life, than any country of Europe for which we have figures, except Austria and Russia." For the causes of this high mortality Mr. Plowden points to the poor and insufficient food of the people, their inadequate clothing, and the prevalence of the epidemics of small-pox and low fever.

10. In his contribution on the statistics of infirmities, Dr. Cleghorn argues that the prevalence of insanity is due to the extreme poverty of the mass of the population, and he develops his views as to that poverty with striking force and earnestness. But the Lieutenant-Governor considers that there is a good deal of exaggeration in what is said on this subject. The number of insanes in the North-Western Provinces is (compared with other countries) very moderate. The appearance and physique of the population are enough to prove that they are not, as a rule, on the verge of starvation. The instances quoted by Dr. Cleghorn are mostly exceptional, and his facts as to the rate of wages and supply of food can hardly be accepted as representing the normal state of things. But still, making allowance for the somewhat exaggerated statement of the penury and the bitter struggle for life among the labouring classes who live by the land, and even among the poorer cultivators, it cannot be doubted that among large sections of the community the rates of food and wages, though fairly sufficient for livelihood in ordinary times, seldom or never provide a fund against illness and scarcity; and it is this which renders every approach to drought and dearth a matter of anxious solicitude to the Administration of these Provinces. There is, as Mr. Plowden says, "room for an immense amount of improvement in the material well-being of the people." But their adherence to traditional habits is such, and the agency at our command is so limited, that the task

indicated is beyond the power of any Government adequately to perform. Such improvement must come from within. It is ours only to see that no impediment is placed in its way. And Sir William Muir believes that during the period of thirty-five years, over which his experience extends, the improvement in the status of the agricultural population, in all matters affecting their comfort and prosperity, has been very considerable.

11. The Caste Statistics are the most unsatisfactory part of the return. Greater accuracy than before has been aimed at, and probably obtained, but still there is much error and confusion in the figures. A really scientific and sound classification is hardly possible in the face of the general ignorance of this subject which prevails among the people themselves, the frequency with which the same caste is called by different names in different places, and the tendency to confuse caste with occupation in the lower classes. But still, the Lieutenant-Governor does not agree with Mr. Plowden that in any future Census the attempt to distinguish castes should be abandoned. Without this it would be difficult to test the returns on the spot, as a person cannot always be identified by his name alone without his caste. And had this distinction been given up,

the discrepancies in the sexes could not have been followed up in the way they have been, nor could it have been shown, as the figures in the margin show, to what castes the stigma of in-

Goojurs, ...	71,631	53,357	40.6

fanticide can with the greatest certainty be affixed.

12. In his remarks on the progress of the population Mr. Plowden points out that the only two Divisions in which the numbers have decreased are Alláhabad, where the fall has been .99, and Jhansie, where it has been 6.98 per cent. In the Doab Districts, Cawnpore and Futtehpore, the decrease is not easy to be accounted for; in the Bundelkhund Districts it is due to the famine of 1868-69. Unfortunately Mr. Plowden has not drawn up any table to illustrate his remarks by placing in juxtaposition the figures of the two Censuses for each district.

13. In conclusion, I am to say that, when the Lieutenant-Governor entrusted to Mr. Plowden the task of reporting on the Census of 1872, much was expected from him, on account of his acquisitions in the science of vital statistics and the reputation he had gained from his Report on the Census of 1865. These expectations have been amply fulfilled. He has devoted himself with unremitting industry to the accurate consolidation and elaborate review of the returns (rendered more numerous in these provinces by the enquiries made into sex statistics with a view to tracing home the crime of infanticide, and by the necessity of comparison with the result of former enumerations), and his Report is characterised by much thought and able research. The Lieutenant-Governor cordially thanks

* Excluding Kumaon and Gurhwal.

and commends Mr. Plowden for the work he has done, and His Honor trusts that His Excellency will also acknowledge his services, and concede to him a substantial token of his satisfaction at the manner in which he has carried out the duties entrusted to him.

I have the honour to be,

SIR,

Your most obedient servant,

C. A. ELLIOTT,

Secy. to Govt., N.-W. P.

REPORT

ON THE

CENSUS OF THE N.-W. PROVINCES.

1872.

THE Census reported in the present volume is the third of a series commencing in 1853. It was taken on the 18th January, 1872, an interval of nineteen years having elapsed since the first enumeration, and seven years since the last synchronous Census of this province in 1865. No striking changes have occurred in the interim. But dearth and even famine have not been altogether absent from the land, and to the sad sufferings of 1868-69, especially in the Jhansie Division, the enumeration tables of that part of the country bear indirect witness.

2. The previous enumerations, which had been made in 1853 and in 1865, have partly familiarised the people with the subject, and though not altogether free from distrust, the popular mind is no longer startled at and shy of inquiries in connection with the numbers of the people. The Census of 1865 had accustomed the inhabitants of the province to inquiries relating to their castes and occupations, while the enumeration of 1853, as well as the subsequent Census of 1865, had investigated the numbers of persons professing the two great religions of the country. The ground having thus been prepared for more extended inquiries, the Census of 1872 has been more comprehensive in its aim than its predecessors. I believe I am correct in saying that the present occasion is the first in India where an attempt, on any extended scale, has been made to classify the population by age.

3. Proceeding on the principle formerly adopted, that the enumeration should be synchronous, and should distinguish the sex, and occupation, and caste of the residents of each house, the present Census went a step further in inquiry by recording the ages of the people, and distinguishing roughly the class of house occupied by them. An attempt has also been made to obtain information of the number of the blind, deaf, and dumb, lepers, insane, and idiots. The nationality of the people residing in the North-West, and the state of education of the male inhabitants, have also been the subject of enquiry. On the important question of the civil condition of the people we are still, it is to be regretted, without information.

4. On previous occasions it was felt that, unless the several residents of a house were entered by name in the enumeration papers, it would be impossible to exercise a proper check on the accuracy of the returns in regard to the number of the people. In the present Census this defect has been remedied. In the enumeration papers the name of every male resident has been recorded, and where it was possible to do so without offence to popular prejudice, the names of the females have also been entered. This, combined with the entry of "Relationship to the head of the house" against every person residing in the house, has yielded a check for testing the returns which has added considerably to their accuracy in regard to the numbers of the people.

5. In this province (and in this matter we are not behind other parts of India) we are still unable to attempt a Census in which the fixed population shall be enumerated by its own agency,—that is to say, where the enumerator has merely to collect the householders' schedules filled up as those are by the occupiers of houses. This inability adds greatly to the labour of the enumeration, but it is somewhat compensated for by the willing assistance of the people themselves, which up to the present time has made the payment of enumerators the exception rather than the rule.

6. The procedure adopted in Census operations in this country has now been so frequently described, that it is not necessary for me to dwell at any length on the *modus operandi* followed in the several districts in the enumeration of 1872. With the exception that the enumerators were occasionally paid for their labour in the Census last taken, there was no difference in the procedure then adopted and that which had been followed in the Census of 1865. Those, however, who wish to do so can obtain more detailed information on the subject from the selected reports, which, together with the more important rules issued in regard to the taking of the Census, will be found in Appendices A. and B.

7. Virtually the enumeration consisted of two operations—*first*, the gradual recording in the prescribed Census form of each inhabitant of each particular town or village in the province; *second*, the correction of this return on the night of the Census, so as to bring it into exact accord with actual facts on the 18th January.

8. The preliminary enumeration, as it may be called, was carried on in the early part of the cold weather, commencing in October, 1871. It was then scrutinized in a most searching manner by the district officers, their assistants, and the tahsil staff. This scrutiny continued from November or earlier to within a few days of the date of the Census, and errors then detected were rectified. These errors consisted for the most part of inaccurate numbering of houses and enclosures, and incorrect entries of particulars of caste and nationality. There were few omissions, though it is reported that occasionally young children were excluded. In no case was there any attempt at concealment. A tendency to include in the enumeration papers daughters who were absent in their husbands' villages, and conversely to exclude daughters-in-law residing with their husbands, was observed in some instances; but the scrutiny which disclosed such a tendency permitted easy rectification of the error where it existed. In a few cases the papers had to be reconstructed, in consequence of a large number of errors having been detected. There is only one instance, however, which has been reported, where it would appear that the preliminary enumeration was carelessly taken and insufficiently checked over any considerable area. This was in Goruckpore, and Mr. Elliott's letter describing the circumstances will be found in Appendix B. The Collector, however, has noted that whatever mistakes were detected were corrected by the superintendents.

9. The final enumeration was effected on the night of the 18th of January by 84,277 enumerators, acting under 10,140 supervisors. The mode in which these men were distributed* throughout the several districts of the province will be seen from the accompanying tabular statement, which also shows what payments were made to them for their work. It will be seen that by far the greater number of them were unpaid, the instances being few where any remuneration was given. Taking the average of the province, there was one enumerator to every 75 houses and to every 365 persons. In the Census of England, taken in April, 1871, the average number to each enumerator was 131 houses and 696 persons.

* In the Kumaon and Gurhwal Districts the enumeration was not effected in the same way as in the plain districts. The village putwarces were the agency employed to take the Census. Captain Garstin's report in regard to the mode in which the Census was taken will be found in Appendix B.

10. The enumerators and superintendents acted under the instructions of the tahsildar and his immediate subordinates, these in their turn being guided by the Collector and his assistants. After the final Census the returns prepared by this agency were again subjected to scrutiny. The examination was necessarily brief, as it took place on the day immediately succeeding that of the enumeration. The errors detected at this final scrutiny were few. In the papers of nineteen villages in the Meerut District, personally tested by myself, but one error was discovered; and in those of eight villages, tested by Mr. Rawlins, a similar amount of error was apparent. In the first case the mistake, which was rectified, consisted in the inclusion in the Census returns of an individual who was absent from his village on the night of the Census. In the other instance, and here the mistake was also corrected, a visitor who had come from the adjoining neighbourhood was not entered in the papers of the village in which he passed the night.

11. There is a general consensus of opinion on the part of district officers that the present Census, as a mere numbering of the people, is as accurate as we can hope to make it with the agency available†. The enumeration papers would appear to be least

* In Kumaon and Gurhwal the work of enumerating the people was performed by the headmen of the villages, and was supervised by the putwarees, or where the headmen were illiterate, was performed by the putwarees themselves.

† This is the total number of the population dealt with by the enumerators. The total population of the province, including those who filled in their own returns, is 30,781,204.

‡ I extract from Collector's reports a few of the remarks on this head:—

BOOLUNDSHUHUR.—“The returns were carefully and well made up.”

BUDAON.—The Collector expresses himself much struck with the accuracy with which the returns were made; and Messrs. Wilson and Crosthwaite both make the same remark.

In Muttra the amount of error is stated to be very small.

In Agra to be very trifling; and elsewhere the mistakes are said to be few and unimportant. Mr. Baker tested the returns of 14 villages and 1,771 houses, and did not find a single mistake.

ETAH.—The returns are said to be good, and will be found accurate.

accurate in the entries under columns showing nationality and particulars of caste. There have also certainly been omissions in the records of particular infirmities. The nature and extent of these errors and omissions can be discussed more opportunely when the statements and tables relating to castes and infirmities come to be dealt with.

12. It was not to be expected, after two previous enumerations, taken without any difficulty, that any special obstacles should be encountered by the local officers engaged in taking the present Census. The reports from Collectors coincide in describing the attitude of the people as one of either utter indifference or vague curiosity, but in no ways indicative of alarm. Willing assistance was given on all occasions; and the only instance in which the existence of any difficulty has been reported is the following, related by the Collector of Benares as occurring at one of the puraos (halting-places), where a number of Gwalior men were resting with their wives and families on their way home from a pilgrimage to Gya:—"These people all refused to give their names, and, declaring that they did not belong to these parts, insisted that the enumerators must have some sinister motive in wishing to record all their names, ages, &c. Although two of the leading men ultimately gave us a list of the names of the party with the other information desired, I was detained at this serai for an hour and a quarter, and had I not chanced to visit it, neither the enumerators nor the superintendent would have been able to induce these men to give any particulars about themselves. I made inquiries, but only heard of two other instances of the same sort,—one, where some five travellers at one of the ghat-puraos refused to give any account of themselves to the enumerators; and another, where a party of Telegu-speaking natives, encamped near Mogul Serai Station, could not be understood by the tahsildar, who had to enlist the services of an interpreter before he could fill up the return."

13. But though a people so amenable to authority as the population of these provinces would not offer any obstacle to an undertaking like the present, the ignorance of the masses, acting on minds easily moved to suspicion, excited distrust as to the objects of the enumeration, and gave rise to rumours, in some cases of a rather remarkable character. Mr. Alexander instances as prevalent among the visionary part of the people of Mynpoory the idea that there was to be a forced conscription of able-bodied males—one or two from each family—to assist in fighting the Afghans and Russians in case they should invade the Punjab. The people, in fact, in other matters as well as this, have not acquired confidence in the motives which prompt the Government to any undertaking with which they are not entirely familiar; and it is quite clear from the reports of district officers that an opinion prevailed very extensively among the lower classes that the numbering of the people was preliminary to some new form of taxation.

14. Two officers alone report that the object of the Census was fully understood by the majority of the people. In no less than 20 out of 33 districts from which reports have been received, the popular impression that the Census was to be followed by some new

In Jaloun there was less than 1 per cent. of error.

In Jhansie errors were found only here and there.

In Banda, it is stated, owing to the people being entered by name in the enumeration of 1872, it is more accurate than that of 1865.

JOUNPORE.—Errors stated to consist of omissions generally among the young children of the lower classes, who seemed surprised to find that Government were concerned with their existence.

AZIMGURH.—Mr. J. Simson writes,—“From all that I have been able to learn, both from actual test and personal inquiry, I believe the returns of the Census to be as correct as can ever be expected from the agency at our disposal dealing with the people of this country, and I have no doubt whatever that they are far more correct than the corresponding returns were in 1865.”

MIRZAPORE.—Omissions stated to be few.

GORUCKPORE.—Mr. Robinson writes,—“The errors detected were few and inappreciable.”

KUMAON.—The errors detected in the Census returns were very trifling. Major Fisher writes,—“As the village returns consisted of a nominal roll of every man, woman, and child in a village on the date the Census was taken, there is every probability that the returns are as accurate as Native agency can make them.”

form of tax is distinctly referred to. Judging from the general tone of the Collectors' reports,* it may be assumed that, though the Census excited no alarm among the lower orders, it was looked upon as the precursor of fresh taxation.

15. Before proceeding to discuss the various statistics of population recorded at the last Census, it is necessary I should notice briefly the system which has been pursued on this occasion in tabulating and working up the information obtained. On former occasions the compilation of the returns supplied by the enumerators, after being scrutinized and tested as already described, had been left in the hands of the local officers, and, as a rule, it was by the Tahsildars and their subordinates that the figures for each tahsil were classified and totalled. These abstracts, again, were compiled into district tables in the Collectors' offices, and were then condensed into provincial statements in the office of the Board of Revenue.

16. The experience gained at the enumeration of 1865 showed this system to be faulty; and it was suggested that the enumeration papers for each village, after being finally tested and examined, should be sent direct to the Board's office for compilation in the event of no special officer being appointed to report on the Census, but if a special officer were deputed to the work, it would become his duty to undertake the compilation. The suggestion thus made has in part been acted upon. It would have been carried out *in extenso* had not objections arisen in regard,—1st, to the propriety of sending this vast mass of returns to one central office without retaining copies in the districts; 2nd, to the difficulty of procuring a sufficiently large number of clerks in any one locality to deal with these voluminous documents. It was accordingly determined by His Honor the Lieutenant-Governor that the original Census returns should be worked up in the several district offices, and the following orders were issued by His Honor:—

“RESOLUTION No. 117A. of 1872.

“*Dated Camp, Oraie, the 7th February, 1872.*

“READ, the following papers on the subject of the cost of the Census of 1872 of the “North-Western Provinces:—

“Letter from the Government of India in the Department of Agriculture, Revenue, and Commerce, “No. 96, dated the 2nd September, 1871.

“G. O. No. 1181A., dated the 19th September, 1871.

“Note by the Senior Member of the Board of Revenue, dated the 12th January, 1872.

“Letter to Government of India, Department of Revenue, Agriculture, and Commerce, No. 9B., “dated the 13th January, 1872, forwarding copy of the above Note, and recommending the “appointment of Mr. W. C. Plowden for the compilation of the final results of the Census.

“Letter from the Government of India in the Department of Agriculture, Revenue, and Commerce, “No. 37, dated the 26th January, 1872, sanctioning the deputation of Mr. Plowden.

“OBSERVATIONS.—Mr. Plowden will, under the authority conveyed in the above “orders, be at once placed in charge of the compilation of the Census Returns and “preparation of the final report.

“2. In modification of previous arrangements, it has been decided that the com- “pilation of the materials contained in the enumerators' papers shall be made in each “district, under Mr. Plowden's general superintendence.

“3. A staff of mohurrirs at about three for each 100,000 inhabitants will be “entertained by each Magistrate to reduce the collected statistics into the prescribed “forms.

“4. The forms into which the enumerators' returns are to be compiled will be “drawn up by Mr. Plowden, and submitted at the earliest date to the Board for ap- “proval. It is expected that all the necessary preparations may be made and the work “begun at the head-quarters of each district by the beginning of March.

“5. Meanwhile, Collectors should have the enumeration papers suitably lodged “and arranged by pergunnahs, villages, and towns. They should also nominate an

* A précis of the Collectors' letters will be found in *Appendix C.*

"assistant for the special duty of superintending the Statistical Mohurrirs, and report the nomination to Mr. Plowden. They should further take measures for securing a suitable supply of Mohurrirs, so that when the forms are ready the work may be commenced without any delay.

"6. Collectors should freely communicate with Mr. Plowden, and follow his instructions as to the course to be pursued."

17. The instructions subsequently issued from this office in regard to the abstracts to be prepared from the enumerators' returns will be found in Appendix A., and I have added a short memorandum on the work of the Central Office.

It will be sufficient here to note that there were three abstracts to be prepared for each village—

- (1)—The main abstract arranging the inhabitants by sex, creed, nationality, caste, and of giving also certain information as to the occupations of the people, their ability to read, and statistics of the blind, deaf and dumb, insane, idiots, and lepers.
- (2)—A synopsis of the number of persons, male and female, distinguishing those of 12 years and upwards from children under twelve.
- (3)—A statement of the occupations followed by males not less than 15 years of age. These were so drawn up as to afford checks on the mutual accuracy of the three abstracts; and from these abstracts, drawn up in the several offices, my office has compiled the statements which accompany this report.

II.—The Statements and Tables.

18. The information collected at the Census has been arranged in the forms prescribed by the Government of India, or in a shape closely resembling those forms. Thus tabulated, the provincial and district results will be found in the following general statements:—

- IA.—Area and population, pages 1-2.
- IB.—Details of population, pages 3-6.
- IC.—Infirmities, pages 7-9.
- IIA.—Population according to age and sex, classified under (a) Hindoos, (b) Mahomedans, (c) Christians and others, pages 10-25.
- IIIA.—Population according to education, pages 26-30.
- IIIB.—Percentages taken from the preceding statement, pages 31 and 32.
- IV.—Area, population, and revenue, pages 33 to 36.
- VB.—Population classified by nationalities, castes, and tribes, pages 37 to 172.
- VI.—Occupations of the male population not less than 15 years of age, pages 173 to 200.
- VII.—Number of villages and towns in each district, classified according to the number of their inhabitants.
- VIII.—Towns containing more than 5,000 inhabitants, classified according to population.
- IX.—Details for the above towns.

19. In the tables—nine in number, and in most instances framed on the same plan as the statements—information is given for the several tahsils and sub-divisions (pergunnahs) into which the province is divided. From I. to VII. they follow nearly the same system as the statements having the same numbers; but Nos. VIII. and IX. have no prototype among the statements.

20. In Volume II., at the close, will be found abstracts of the population of each city containing more than 50,000 inhabitants. These abstracts classify the population in the same form as the main abstracts already referred to as having been compiled in the district offices. It has been thought advisable to give similar information in Table VIII. for the towns (53 in number) the population of which is between 10,000 and 50,000 ; and in Table IX. the occupations of the male residents, not less than 15 years of age, of the towns and cities have been given.

21. It is necessary to keep in view that, with the exception of Statements Nos. I and V., none of these statements or tables deal with the European portion of the population of the province. Only those exceptional cases, where Europeans or Eurasians have been returned in the vernacular enumeration forms, are included in the statements and tables other than the two specified above. The numbers of the non-Asiatic population are so limited, and the information concerning them was in so many cases defective, that I have thought it best to deal separately with this small fraction of the population ; and I have felt less hesitation in adopting this course, as the numbers of the Europeans have already been recorded separately for the Census of Great Britain in 1871. But to complete the statements for this report as far as possible, I have added an abstract (on the following page), giving for each district the total population classed as non-Asiatic, Eurasian, Native Christian, Hindoo, and Mahomedan, and distinguishing the sexes.

Abstract of the Total Population

* Non-Asiatics include Europeans, Americans, Africans, and Australians.

22. On a comparison of this abstract with Statement IB., it will be seen that the variation in the numbers and density of the total population of each district, caused by the addition of the non-Asiatic element, is most trifling. It would have been more satisfactory to have shown throughout the series of statements and tables the entire population, however composed, whether foreign or native to the country. But this has been impossible, owing to the defective nature of the information supplied for the European* portion. The main defect in the returns for this part of the population consists in the omission of ages and other details. In some cases only the numbers and sexes have been distinguished; in others, the professions and the nationalities have been excluded. Endeavours were made, but without complete success, to remedy these defects. Such information, however, as has been collected regarding the ages and occupations of Europeans, Eurasians, and non-Asiatics, will be found in the last appendix to the report.

23. Before commencing any examination of the figures disclosed in the statements and tables, it will be convenient to notice such territorial changes as have taken place in the interval that has elapsed between the Census of 1865 and that of 1872. These have been few. The only alteration of importance that has occurred consists in the transfer of the Ajmere District† to the immediate control of the Supreme Government. Geographically that district never formed a part of this Province; but it was not till 1870 that its administrative connection with what is somewhat inaptly termed the North-West was severed.

There were, in addition, the following unimportant transfers of territory to adjoining provinces :--(a) From the Shahjehanpore District 35 villages, embracing an area of 67 miles 376 acres, have been transferred to the adjoining province of Oudh; (b) from Jaloun one village, area one mile 511 acres, has been transferred to the Sumthur State; (c) from Jhansie 20 villages, with an area of 43 miles 320 acres, have been made over to Maharajah Scindia. On the other hand, one village, with an area of one mile

* Owing to the Camp of Exercise at Delhi having been held during the month of January, 1872, the number of Europeans and Military which should appear in the enumeration returns of the North-Western Provinces has been considerably diminished, Delhi being outside the limits of the Province. The following statement shows their number, both European and Native, at the time of the Census :—

Statement showing the total number of Military (combatant and non-combatant) in the Cantonments and Forts and Depôts in the N.-W. P., distinguishing European and Native.

Name of Cantonment, Fort, or Depôt.	NUMBER OF ALL RANKS.		Number of European Females.	NUMBER OF EUROPEAN CHILDREN.

† The area of Ajmere, as given in the returns for 1865, was 2,672 miles 83 acres, and the population 426,268.

This gives a—

Gross Increase.
1,511 acres.

Gross Decrease.
67 miles 376 acres:
1 " 511 "
43 " 330 "

112 miles 577 acres:
1 " 511 "

Leaving net decrease of, ...111 miles 66 acres.

24. Appended to this report is a note explaining the differences in area in the several districts composing the Province. I have excluded Kumaon from this note, because the area given is the estimated, and not the measured, superficies of that region. At the former Census it was estimated at 11,000 square miles. There is reason to believe this figure is somewhat under the mark, and the area is now taken at 11,500 square miles. Apart from the decrease of 111 square miles already noted, and allowing for the exclusion of Ajmere from the present Census, there is practically no difference in the area of the Province as given in 1865 and 1872. Though the figures for the two returns vary slightly, these variations, where they exist, are due really to differences in measurement, and do not represent any actual decrease or increase in the area of the several districts.

25. The Government Administration Report for 1871-72 shows a total area of 81,347 square miles, and distinguishes the principal geographical divisions of the country under the North-West Government as—

1st.—The Kumaon Himalayas, the area of which is given as 15,968 square miles.

2nd.—The plains north of the Jumna and Ganges, comprising 34,980 square miles.

3rd.—The tract south of the Jumna and Ganges, containing 25,489 square miles.

In examining the density of the population in the Province, this distinction cannot be followed exactly, because the areas given in this report do not agree with those shown above.* But it will be well to keep in view the distinction between the Kumaon Himalayas and the plain districts. For this purpose I shall take as the Kumaon Himalayas the country to the north of the Sewaliks (the Dehra District), and the two Kumaon Districts. In the physical characteristics of these and the districts in the plain divisions there are marked differences, which make it convenient to draw a broad distinction between the two tracts.

III.—Density of the Population.

26. The entire population returned at the Census of 1872 as inhabiting the territory under the North-West Government consists of 30,781,204 persons, of whom 16,413,642 are males, and 14,367,562 are females. The non-Asiatic element, including Europeans, Americans, Australians, and Africans, is represented by 12,433 persons, of whom 7,502 are males, and 4,931 are females. There are in addition 2,701 Eurasians, of whom 1,213 are males, and 1,488 are females; and the returns also show 7,648 Native Christians, of whom 4,000 are males, and 3,648 are females. The Hindoo population numbers 26,569,074, composed of 14,217,360 males, and 12,351,714 females. The Mahomedans muster 4,189,348, of whom 2,183,567 are males, and 2,005,781 are females.

* None but those who have had to undertake the task can realize fully the difficulty of securing accurate Indian statistics with the agency available. The area of the several districts in the Province, and of the Province itself, would seem to be a matter on which there could be no dispute, but it is differently stated in two adjoining pages of the Administration Report of the Government, in the Revenue Administration Report by the Board, and in the present report. The district area returns supplied to the Board of Revenue for the Census Returns disagree in many instances with those afterwards sent up from the district offices, giving details of the revenue-paying, revenue-free, and cultivated areas. In some cases three varying returns have been sent up from the same office at different times; and in the Allypore District a variation of one hundred and four square miles is accounted for by that amount of area having been omitted from the area statements of 1865. It must be remembered that the total area for the Province now shown, 81,403, does not include that occupied by the courses of the larger rivers.

27. Including Kumaon, the area occupied by these thirty and three-quarter millions of people is 81,403 square miles. The density of population is therefore 378 persons per square mile, and the figures show that of these, 201 are males, and 177 are females.

28. The great density of the population in many of our Indian provinces has now become so patent to the explorer of official records, that I abstain from making more than very brief comments on this subject. The North-Western Provinces take a high position in any table of countries ranked according to population; and even among Indian provinces it stands out conspicuous for the number of persons it supports on each square mile,—having the highest density of population of any of the five Indian Governorships or Lieutenant-Governorships. Compared with European population, it stands third in rank, being higher than all but Belgium and England with Wales. It is almost exactly on a par with Saxony, and is considerably greater in density than any of the other countries noted in the subjoined table :—

TABLE C.

Countries.	Year.	Population.	Area in English square miles.	Population per square mile.
Belgium, ...	1870, ...	5,087,105	11,372	447
England and Wales, ...	1871, ...	22,704,108	58,320	389
Saxony, ...	1871, ...	2,556,244	6,777	377
Netherlands, ...	1870, ...	3,915,956	13,464	291

Austria, Hungary, ...	1869, ...	35,904,485	226,406	158
France, ...	1872, ...	36,102,821	201,900	150
Denmark, ...	1870, ...	1,784,741	14,553	111
Scotland, ...	1871, ...	3,358,613	30,685	109
Portugal, ...	1868, ...	3,995,152	36,510	108
Spain, ...	1860, ...	16,301,850	182,758	90
Greece, ...	1871, ...	1,457,894	19,941	73
North-Western Provinces, ...	1872, ...	30,781,204	81,403	378
Bengal, ...	1872, ...	66,856,859	248,231	269
Madras, ...	1872, ...	31,312,150	141,766	221
Punjab, ...	1868, ...	17,611,498	101,829	173
Bombay, ...	1872, ...	18,983,998	87,639	169

29. The tract termed the Kumaon Himalayas, which is essentially different in character from the plain districts, is included in the figures given against the North-Western Provinces in the above table. If it be excluded from consideration by excising the districts of Gurhwal, Kumaon and Dehra, we find the plain districts of the North-Western Provinces exceeding in density of population every other country but Belgium, and supporting 434 persons on every square mile. This figure, however, is surpassed by the Oudh territories adjoining the North-Western Provinces, which exhibit (Census Report for 1869) a density of 474 persons to the square mile.

30. The accompanying tables D. and E. display in detail the relative density of the several districts of the North-Western Provinces, Bengal with Behar, and Oudh. Those who desire to go further into this subject, and to compare the figures for this Province with those for European countries, will find the means for so doing in tables FI., II., III., IV., which give full information for the English countries, the French Departments, and the Belgian and Italian* Provinces.

* It was noted in the Census Report for 1865 how strikingly similar to the Upper Provinces those of Belgium appeared to the eye of the first Indian Minister of Finance, the late Mr. Wilson. To those acquainted with the North-West, quite as striking a likeness suggests itself in the journey from Ancona northwards to Bologna in spring. The high cultivation, tall crops, constant recourse to irrigation, industry of the agricultural population, the early resort of the cultivator to his field, the use of bullocks in plough and cart, and the frequent recurrence of villages and towns, all suggest points of resemblance between Mid-Italy and Upper India. The very climate of the Upper Provinces from the beginning of November to the middle of March is Italian in feel; but for the contrast between the rugged lines of the Italian mountains and the monotonous level of the Upper Indian plain, the traveller by rail through Italy in spring and Upper India in the cold weather might imagine himself in the same country. No one can fail to be impressed by the many remarkable resemblances in the aspects of the two countries. The similarity too between the Metayer tenures of Italy and the Bhatta rents of the North-Western Provinces is noteworthy.

TABLE D.

	7	1042	5,300	203	...
* The percentage of cultivation on area for 1872 is not given for the entire district, but is the proportion for the area given by the Collector in Table IV.					
† Percentage of cultivation on area cannot be given for 1865, as the districts of Goruckpore and Bustee, were not separated until after that year. The figures for the combined districts for 1865 are given below :—					
	Percentage on cultivation.	Area.	Cultivation.		
Goruckpore, }	55.9	7,400.81	4,140.99		
Bustee, " " }		Square miles.	Square miles.		

Goruckpore, " " " ") Percentage on cultivation.

Year	Population	Area (sq. miles)	Density (per sq. mile)
1800	7,400	18,000	0.41
1850	14,000	18,000	0.78
1900	24,000	18,000	1.33
1950	41,000	18,000	2.28

not separated. Area.

7,400·81
square miles.

TABLE FIV.

Density of Population in the Provinces of Belgium.

Provinces.					Area in square kilometres.	Number of inhabitants.	Population per square mile.
Antwerp,	2,831.78	492,482	476
Brabant,	3,282.96	879,814	694
Flanders W.,	3,234.67	668,976	623
Flanders E.,	2,939.95	837,726	722
Hainault,	3,721.62	896,285	624
Liège,	2,893.88	592,177	530
Limbourg,	2,412.34	200,336	222
Luxembourg,	4,417.76	205,784	121
Namur,	3,660.25	313,525	97

31. It will be observed that there are no districts in the North-Western Provinces which come up in density to the high figures of Hooghly and the Presidency, both comprising large areas. Benares, Jounpore and Ghazeepore are the only districts with a rate above 600; Benares, however (797), comes within three of 800. There are ten districts ranging between 600 and 500. Bengal, on the other hand, has fifteen districts with a rate of density between 800 and 500, against 13 districts in the North-West Provinces. Darjeeling, as might be anticipated from the similar conditions of their physical geography, assimilates very closely to Kumaon in regard to the sparseness of its population.

There is no part of the North-West Provinces which comes down to a level with the figures for the Chittagong Hill Tracts or Hill Tipperah in regard to scarcity of inhabitants.

32. Compared with England, we find the density of population in the North-West districts far higher than that of the agricultural counties. Indeed, the average throughout this province, even when the mountainous tracts of the Kumaon Himalayas are included, is much above the rate prevailing in Berkshire, Buckinghamshire, Cambridgeshire, and in the East and North Ridings of Yorkshire. It is only in the manufacturing districts and in the Metropolis that the converse holds good.

33. In France—with the exception of the following, Gard, Rhone, and Seine, the two first of which contain large manufacturing towns, while in the third is situated the capital of the country—there is not a single Department which in rate of density approaches the average of the North-West Provinces.

34. In Italy, the only provinces that in density of population surpass the average rate of the North-West are Naples, Como, Cremona, Genoa, Lucca, and Venetia.

35. In Belgium, the most densely populated province exhibits a lower rate than Benares District; and East Flanders, with a density of 722 persons to a square mile, exceeds but little in area the Benares District with a density of 797 to the square mile. Benares contains 996 square miles, while the area of East Flanders is 1,154 square miles. The whole population of Belgium is very slightly above that of the Agra Division in numbers. The latter tract, however, supports on each square mile a much larger number of persons than Belgium. The figures are—

	Area in square miles.	No. of inhabitants.	No. of persons per square mile.
Belgium,	11,373	5,087,105	447
Agra Division,	10,163	5,040,919	496

In Table I. will be found the rates of density in each of the sub-divisions (per-
in the Province. These vary, it will be seen, from 6,923 in Dihát Amánat.

in the Benares District, to 36 in Agoree, in Mirzapore. The city of Benares is contained in the first named sub-division, and its high density is thus explained. But it is not only in the great cities high rates of density are observed.

I append a list of not less than 104 pergunnahs, not one of them containing a town with 5,000 inhabitants, which vary in density from 1,122 in Shíopúr (Benares District) and 1,073 in Faizabad (Jounpore District), to 50 in Bughra (Moozuffurnugur District.)

Three of these show a rate exceeding 1,000. Seven of them exceed 700; thirty-five vary between 700 and 600, and the remaining sixty all exhibit rates exceeding 500.

37. The above remarks and figures indicate sufficiently the great pressure of population throughout the Province.

The importance of the subject in connection with the food supply, health duration of life, and distribution of wealth, of the people cannot be over-estimated; and it is possible the information contained in the statements and tables relating to the ages, infirmities, and occupations of the people may permit of further treatment of the question. In the meanwhile, I pass on to the distribution of the people by creed.

IV.—Religion of the People.

38. The inhabitants of the Province may in regard to religion be distinguished broadly as Hindoos and Mahomedans. As Mr. Beverly has remarked in his Report on the Bengal Census,—“It is difficult to say where the line should be drawn which is to “separate the pure Hindoos from the low castes which have adopted some or other “form of Hindooism. The problem can only be satisfactorily solved by a clear defini- “tion of what we mean by Hindooism, and no one has ventured as yet to lay down any “such definition. It was only the other day that we were reminded by High authority “that Hindoos are only heathen little differing from the aboriginal tribes who worship

“stocks and stones. What, then, is to be the test of faith which is to distinguish the real Hindoo from the semi-Hindooised aboriginal? Which of the gods in the Hindoo pantheon shall be made to step down and decide between them? Shall a belief in Krishna or in Doorga constitute a pure Hindoo? Or shall those only be classed as Hindoos from whose hands a Brahmin will receive water? Shall the disposal of the dead be made the test, and the various castes be distributed according as they practise cremation or burial? Or shall some form of creed be extracted from the Shasters, which we may make those subscribe who are henceforth to enjoy the dignity of being styled Hindoos? Some practical shibboleth of the kind is required it is clear; without some such test no two men will agree in the classification of the numerous aboriginal tribes and castes in India who profess Hindooism in some or other of its multifarious forms.”

39. In these Provinces the impress of the Hindoo religion has left its mark on the invader as well as the aboriginal tribes and castes; and we find instances of the descendants of Mahomedan converts, who embraced the Mahomedan faith often at the edge of the sword, retaining Hindoo customs and adhering to observances and ceremonies which are purely Hindoo. In the statements distinguishing the religion of the people no critical separation has been attempted. They have been drawn up in accord with the enumerators' returns, with the exception of those few cases where the classification adopted in the enumerators' returns has been obviously incorrect: for example, where Domes have been recorded as Saiads, or Bilochis have been shown as Hindoos; in both of which instances the classification in the abstracts is clearly erroneous.

40. The portion of the community entered under the head “Christians and Others” is extremely small, and comprises generally Native Christians, Eurasians, and the few Europeans who have been recorded in the enumeration returns, together with the sprinkling of Chinese, Parsees, Affghans, Armenians, Cashmerees, Nepalese, and others who will be found entered in the nationality statement at pages 42 and 43. The entire number of persons distinguished as other than Hindoos and Mahomedans is only 10,640, of whom 5,909 are males, and the remaining 4,731 are females.

41. The Hindoos number 26,569,068, while the Mahomedans muster 4,189,348. Thus, out of every 1,000 inhabitants in the Provinces, it may be said 863 are Hindoos and 136 are Mahomedans, while one person will be found in every 3,000 who is not Hindoo or Mahomedan. From the Census of 1872 there would appear to be 100 Mahomedans to every 634 Hindoos, against 100 Mahomedans to every 613 Hindoos in 1865.*

42. Considered in reference to locality, the Mahomedans are most numerous in the Northern Divisions. Rohilkhund and Meerut contain more than half (2,309,549) of the entire Mahomedan population. In the Benares and Agra Divisions another million and a quarter will be found, the great bulk residing in the former Division, where are the homes of 889,935 Mahomedans. In the Jhansie Division they are comparatively few in number, and in the Kumaon District they form an inappreciable element in the population. It is necessary here to explain what would otherwise appear a remarkable falling-off. In the Report for 1865 the Mahomedans in the Kumaon District are shown as one to every five Hindoos, while in the statements for 1872 they are given as one to every 100 Hindoos. The returns for 1865 for Kumaon were erroneous. The error unfortunately was not discovered till after their publication. A large number of the inhabitants of that district were entered in the district tables as Mahomedans who should more properly have appeared with Hindoos. They comprised classes who occupied the debatable ground, which, strictly speaking, belongs neither to Hindoos nor Mahomedans, but approximates more closely to the former than the latter. Similar instances of the inclusion of these doubtful castes with Mahomedans and others in the Census of 1865 have been brought to light in the Districts of Deyrah and Meerut.

* These figures do not exactly agree with the proportions shown in the Report for 1865, but in the present case allowance has been made for the exclusion of Ajmere, and for the Europeans, Eurasians, and Native Christians who were included with Mahomedans in the returns of 1865.

43. I shall not here attempt to enter into the question of the relative progress in numbers made by these two great sections of the community since the enumeration of 1865. This can be discussed more opportunely with the movement of the population generally. In the accompanying tables (H.I. and II.) will be found figures illustrating the present position in regard to numbers of the Mahomedans and Hindoos in the divisions and districts of the province. The close approach to one another of the figures indicating the percentage of the Mahomedans in each district on the total population for 1865 and 1872 is, I think, indirect proof of the accuracy with which the numbers of the people have been given. The cause of the variations in Dehra and Kumaon, the only districts in which they are noticeable, has already been explained.

TABLE H.I.

Distribution of the Hindoos and Mahomedans by Divisions.

Division.	Hindoo.			Mahomedans.			Proportion of Mahomedans to Hindoos.	Percentage of Mahomedans on total Population.
	Both sexes.	Males.	Females.	Both sexes.	Males.	Females.		
Meerut, ...	3,913,135	2,125,748	1,787,387	1,038,599	556,778	501,822	100 to 370	21.4
Rohilkhand, ...	4,182,728	2,282,888	1,919,840	1,251,342	652,710	598,632	100 to 331	23.0

V.—The Agricultural and Non-Agricultural Sections of the Population.

44. In the Report for 1865, the general statements and tables distinguished those portions of the Hindoo and Mahomedan population which followed agricultural pursuits from their fellow-religionists pursuing trades or other occupations not immediately connected with agriculture. In the present volume this distinction has not been made in the statements and tables, as the information will be found in Volume II. for divisions, districts, and pergunnahs. It will be convenient here to sum up that information.

45. Previous enumerations of this province and other parts of India have brought out very unmistakably how large is the proportion of the population following agricultural pursuits; but in the North-West, previous to the present Census, no further separation of the agricultural from the non-agricultural population was attempted than that involved in the broad classification "agricultural and non-agricultural." In the enumeration of 1872 an endeavour was made to distinguish the proprietors from the tenants, or perhaps it would be fitter to say the landowners from the cultivators; and the enumerators were instructed, when a person derived "the whole, or the greater part, of his subsistence from the land," to enter in the occupation column of the returns the word landholder or cultivator, as the case might be.

In the tables contained in Volume II. full information on this subject will be found, and from them the accompanying abstracts have been prepared. These show the number of the agricultural members of the community of all ages and sexes for each district of the North-West Provinces, and further classify this portion of the population by religion and sex, distinguishing landholders, as so enumerated, from those returned as cultivators. As recorded by the enumerators, we find the following results:—The agricultural community, including under this term only landowners and cultivators, is represented as 17,376,967 out of a total population of 30,769,056, or in the proportion of 56·5 to every 100 of the population.

46. Compared with 1865 the figures stand thus—

Landowners and Cultivators.

Both sexes.			Males.	Females.	Percentage on total population.
1872,	...	17,376,967	9,352,633	8,024,334	56·5
1865,*	...	17,481,903	9,439,027	8,042,876	59·0

For other Indian Provinces† the figures are—

Total population, both sexes.				Agricultural, both sexes.	Percentage.
Central Provinces,	9,104,511	4,879,431	53·6
Punjab,	17,611,454	9,863,580	55·9
Oudh,	11,193,075	6,242,879	55·8
Bihar,	5,531,563	3,259,378	59·1

47. In the North-Western Provinces the landowners are put down at—

Both sexes.	Males.	Females.
2,016,940	1,056,215	950,725.
and the cultivators at—		
15,350,027	8,256,418	7,093,609.

* Exclusive of Ajmere.

† The Bengal Census Returns do not supply means of comparing with any accuracy the proportions borne by the total agricultural population of all sexes and ages to the total population.

If these figures could be relied on as defining within at all accurate limits the landowning and cultivating classes, we should have, excluding the Kumaon Division and accepting the average number of a family as 4½, 347,064 landholders, owning 69,903 square miles of land, or an average of nearly 130 acres to each proprietor. There is reason to believe that the average holding of each proprietor throughout the country is considerably below this figure, and for some districts the Settlement Officers' reports enable us to test the correctness of the number of landowners shown in the Census papers.

48. It is to be regretted that every Settlement Officer's report does not contain information on this head, and that the number of proprietors, tenants with occupancy rights, tenants without occupancy rights, and tenants-at-will is not given in each of these useful official records. Such information would be of the greatest value in any attempts, such as are at present being made, to legislate for landlord and tenant, and in other ways. There is no difficulty either in obtaining it, as the settlement records (vernacular) give complete details regarding the status of the agricultural classes. But I have looked in vain through several of the settlement reports submitted within the last few years for information on this head. From eleven reports, however, that I have gone over I have been able to select three in which these valuable statistics have found a place. These three examples are ample for the purpose.

49. In the three districts given below I have extracted from the occupation statement (No. V. of this Report), and from the several settlement reports, the figures given in them for landowners and cultivators :—

			Landowners	Cultivators.	Total, both combined.
Saharunpore,	...	Census Report,	16,856	94,170	111,026
Ditto,	...	Settlement Report,	46,783	54,209	100,992
Boolundshuhur,	...	Census Report,	7,299	141,269	148,568
Ditto,	...	Settlement Report,	14,206	79,313	93,519
Budaon,	...	Census Report,	11,216	193,384	204,600
Ditto,	...	Settlement Report,	16,855	166,290	183,145

50. It will be observed that the landowners according to the Census Returns are in every case, and in some instances very largely so, below the figure for the same class given in the settlement report, while, on the other hand, the cultivating class as recorded in the Census tables outnumbers the same class as recorded in the settlement report. In every case the total of the two classes landowners and cultivators as taken from the Census is in excess of the total obtained by adding up the figures for the same classes in the settlement report.

At first sight there appear to be such variations between the totals from the two different returns in the several districts in question as to deprive the comparison of any value. But a more thorough investigation will remove what at first sight is doubtful. Of the three districts given, Budaon is the only one for which the settlement figures are taken for much the same period as the Census figures. In both Saharunpore and Boolundshuhur the reports go back to a time before the Census of 1865. But it may be said, Why should there be such an immense difference between the Census figures and the settlement figures in Boolundshuhur, while in Saharunpore the difference is comparatively small? In Boolundshuhur the Census figures show an increase of 59 per cent. over the settlement figures, while in Saharunpore they show an increase of only 9 per cent. over the settlement figures. The reply to this is, that while the population in Saharunpore has only increased 2 per cent. since 1865, in Boolundshuhur in the same time the population has increased 19 per cent. Now, the Census figures would probably be somewhat higher than the settlement figures, because they comprise all males whose age is not less than 15 years, while presumably the settlement records do not include all agricultural males down to so low an age; and in some cases certainly do not include

every agriculturist. When three or four brothers or relations hold a plot together, the tenancy is sometimes shown as that of the elder. We find, on a comparison of the two returns, results in accord with what might be anticipated.

The Census statements may, I think, be accepted as giving, within generally accurate limits, the number of the people engaged in agricultural pursuits. The attempted distinction between landowners and cultivators has undoubtedly failed.

51. There is a large labouring population recorded in the occupation statements, a part of which is concerned in agriculture, and I have little doubt that the difference in the percentage of agricultural on total population, as shown in 1865 and 1872, is attributable to the recording of this portion under their distinctive heads. The percentage in 1865 was 59.0, and in 1872 comes out as 56.5.

52. We still find, as on former occasions, a marked difference in the proportion the agricultural element bears to the total population among Mahomedans and Hindoos.

Throughout the Province, to every 1,000 Hindoos there are 599 agriculturists; to every 1,000 Mahomedans, there are only 351 of the same creed.

The hill districts are those in which the non-agricultural population is smallest, and in this respect Goruckpore and Bustee come very close to Gurhwal and Kumaon. Saharunpore, Moozuffernuggur, and Bijnour would appear to have the largest proportion of inhabitants following pursuits not agricultural; but here it is evident that the labouring population forms a large portion of the agricultural class. There are no cities in either Bijnour or Moozuffernuggur, nor is Saharunpore a district of commercial importance. The labourers entered in Statement V. against these three districts would, with their families, raise the figures for the agricultural class very considerably. To make the statements complete, I have therefore added an abstract, showing the number and percentage of the agricultural and labouring classes of the male sex. In the three districts, where the proportion of the agricultural class is so conspicuously low, the same low figures were noticeable in 1865, and with the exception of Moozuffernuggur, the percentages in the two years have hardly varied, the figures being—

Saharunpore. Moozuffernuggur. Bijnour.

1872,	...	35	36	38
1865,	...	36	41	39

I cannot account for the difference in Moozuffernuggur, unless it is attributable to the different modes of classification pursued on the two occasions.

In the four abstracts which follow (K.I.—IV.) full information in regard to the agricultural population has been given. In reading the last table it must be remembered that the occupation statement deals only with the male population not less than fifteen years of age, and the percentages in that table have therefore been struck on the total male population of 15 years of age and upwards.

TABLE K. I.

Agricultural Population, distinguishing—

Districts	<i>Hindoos.</i>			<i>Mahomedans.</i>			Total of agricultural population.	Percentage of Hindoos agricultural on total population.	Percentage of Mahomedan agricultural on total population.	Percentage of agricultural of all creeds.
	Both Sexes.	Male.	Female.	Both Sexes.	Male.	Female.

53. Statements 1A. and 1B., with which only I have hitherto dealt, are merely introductory to those that follow ; and, though they to a brief extent illustrate the position of the population in regard to sex as well as creed, it will be more convenient to take up this subject when considering the ages of the population by sex and creed as brought out in the Statement No. IIA. Immediately preceding Statement IIA. comes No. IC., in which has been grouped together such information as has been collected at the Census concerning the blind, deaf, and dumb, insanes, idiots, and lepers in the Province. I propose taking this up in a later section, and before discussing either the education or the physical infirmities of the population, to notice such statements as bear on its distribution by sex and age.

VI.—The Population by Sex.

54. The inequality in numbers of the two sexes has, with one exception, in every enumeration of this or any other Province of the Bengal Presidency been a stumbling-block to the statistical enquirer.

A similar inequality has been found in the Bombay districts, and though the town of Madras exhibits a somewhat different proportion of the sexes, I believe that throughout the Madras Presidency the position in numbers of the two sexes assimilates to that observable in the Western and Northern Provinces.

In Bengal Proper the late Census disclosed results which are contrary to previous experiences of Indian enumerations. There the females approach in numbers very closely to the males.

In European countries, though there is an excess of male births, the number of females is generally in excess of the males. But closer observation discloses to us the fact that in the more southern climates of Europe there is a preponderance of males ; and it will be observed in the accompanying table* (No. LI.) that in Italy and Greece the males outnumber the females, being to every 100 females in Italy 100·3 males, and in Greece 107 males. It would be of value, for the purpose of analysing our returns for this province, if we could compare them with those of the more southern provinces of Italy. Unfortunately the complete details of the last Italian Census of 1871 had not been published in July last when I attempted to procure them, and the brief abstract of the Italian Census which has been issued to the public

* I am indebted to the courtesy of the Minister of the Interior for France for this abstract, which is taken from Vol XX. of the 2nd series of the "*Statistique de la France*." The figures for Italy give the mean for six years—1863-1868 ; those for Greece give the mean of three years—1866-68.

draws no distinction between the sexes, but gives only the total of both sexes combined for each district. From the Austrian Census returns for 1870, I find the most southerly province, Dalmatia, on the Adriatic Coast, exhibits similar results to those observable in Greece,—the males being to the females as 105 to 100. The figures for Dalmatia are males 233,334, females 222,627 :—

TABLE L.I.

Norway, ...	823,951	854,344	1,678,295	Greece, ...	736,898	688,248	1,425,146
Denmark, ...	837,090	851,510	1,688,600	Russia (in Europe),	30,082,790	30,826,519	60,909,309
Prussia, ...	9,872,518	9,949,738	19,822,256				

55. These facts, the results of careful observation in European enumerations, permit us to question whether it is an inevitable law of nature “that while slightly more males are born into the world, the sexes of adult age exist in equal numbers.” In truth, the mere fact that the birth-rate of males to females keeps on increasing in proportion as we proceed southwards must result, all other conditions being the same, in a greater preponderance of males over females alive in the southern countries as compared with the north. To every 1,000 births of both sexes we find—

In France,	512 male births.	In Austria,	515 ditto.
Russia,	512 ditto.	Italy,	516 ditto.
England,	513 ditto.	Greece,	526 ditto.

It is not therefore improbable that, for all ages taken together, the males should outnumber the females by 7 per cent. in Greece, where the male births are so largely in excess of female births. What may be the causes at work to produce these results in Southern Europe, and whether they are conditions which repeat themselves in India, it is not my intention to examine.*

56. In Statement I.B. we find that, for the whole Province, the Census gives the following results in regard to the classification of the population by sex :—

Of every 1,000 persons, 533 are males and 467 are females. The proportion of the sexes varies in the different sections of the community, the Hindoos having 576 males to every 424 females, while among the Mahomedans there are 521 males to every 479 females.

57. In the following abstract (L.II.) will be found the proportions borne by the two sexes in the various Indian Provinces for which I have obtained the information. These proportions vary as the population follows agricultural or other pursuits, and to illustrate these variations, I have extracted from Vol. II. figures marking what is the proportion of females to every thousand males in the agricultural and

* In the Census Report for 1865 it was pointed out that possibly climatic influences and physiological laws might in some way account for the large preponderance of males over females in this country. The influence of hot climates on the proportion of male births, which was then noted, has had new light thrown upon it by the reporters on the French enumerations (*vide* page 29, Tome XI, “La France : Mouvement de La Population.”—Deuxième Série).

non-agricultural classes. Similar figures for the adjoining Province of Oudh are] also added for purposes of comparison :—

Oudh, agricultural class, ...	1869	912	907	984
Ditto non-agricultural class, ...	1869	954	948	985

58. Here we observe that, compared with 1865, the figures brought out in the last Census show slightly better results than were exhibited before. But the disproportion between the sexes is still quite outside the limits within which it is confined in European countries.

The improvement is perceptible through both the religious sections of the community, and can be traced throughout the agricultural and non-agricultural classes, the Mahomedan non-agriculturists still retaining the best position of all the six classes given in the statement of proportions. The North-Western Province is, however, still much below Oudh in the proportion borne by the females to males.

59. The position of the various districts from this point of view can be examined by a reference to columns 23, 25, 27 of Statement I. The following results appear. Taken up without reference to creed, we find the males varying in proportion to the females, in the total population of both sexes, from 588 in a thousand to 502 in a thousand. The greatest disproportion is found in Deyrah and the smallest in Gurhwal. Deyrah, however, is peculiarly situated. It is composed of two tracts, quite separate in character and both dissimilar from the plain districts. One portion is a young colony in the plains, the other portion covers a mountainous tract within the Himalayas.

Throughout the hills we find in the present enumeration much more equal proportions obtaining among the sexes than are found in the plains. The state of the Deyrah Valley, sparsely populated as it is, and with a large portion of its small population consisting of labourers who have immigrated to take up new ground, sufficiently accounts for the great preponderance of males observable there. I therefore pass by Deyrah, and turn to the district which stands next as most conspicuous for the great preponderance of males. In Mynpoorie the proportions are—

558 males to every 1,000 persons of both sexes.

559 males to every 1,000 Hindoos of both sexes.

532 males to every 1,000 Mahomedans of both sexes.

60. Below are given figures for the six districts most conspicuous for the deficiency of females, and the six districts in which this deficiency is least marked.

TABLE L.III.

Names of Districts.				Total population.	Hindoos.	Mahomedans.
Mynpoorie,	558 to 442	559 to 441	532 to 468
Etawah,	553 to 447	555 to 445	522 to 478
Turrae,	552 to 448	554 to 446	549 to 451
Saharanpore,	548 to 452	556 to 444	532 to 468
Mozuffernugger,	544 to 456	549 to 451	531 to 469
Etah,	544 to 456	546 to 454	523 to 477
Gurhwal,	502 to 498	500 to 500	768 to 232
Benares,	512 to 488	513 to 487	508 to 492
Mirzapore,	513 to 487	513 to 487	515 to 485
Allahabad,	513 to 487	516 to 485	499 to 501
Banda,	516 to 484	517 to 483	501 to 499
Ghazee pore,	517 to 483	520 to 480	503 to 497

61. Out of thirty-five districts, in twenty the disproportion of females to males is more than the average, even though that average appears excessive to the European observer. On the other hand, there are two districts where in a particular section of the population the males do not outnumber the females—the one Gurhwal, the other Allahabad. In the former, the rate is taken from a Hindoo population of 308,398; in the latter, from the Mahomedan population, numbering 181,574. These are circumstances which throw great doubt on the accuracy of the returns in reference to the respective numbers of the two sexes.

62. The proportions in which the sexes are found in fifteen countries in Europe have been given by M. Legeyt in his article on population in the “Dictionnaire de l'Economie Politique,” and his remarks on this subject are extracted below:—

“Le rapport moyen entre les deux sexes calculé pour 15 de ces États,* est de 4961 individus du sexe masculin, et de 5039 du sexe féminin, sur 10 mille habitants. Ce dernier terme varie entre 5,003 en Prusse (minimum), et 5,169 en Suède (maximum), c'est-à-dire que la supériorité numérique du sexe féminin est moins grand en Prusse et plus grand en Suède que dans les autres pays de l'Europe. Seuls de ces pays, le Piémont et la Sardaigne offrent le phénomène de la prédominance du sexe masculin dans le rapport de 5,024 à 4,976. Nous avons vérifié que cette prédominance constatée par deux dénombrements successifs, et qui, par conséquent, ne paraît pas devoir être attribuée à une erreur dans les opérations, ne trouve pas davantage son explication dans un excédant exceptionnel des naissances masculins et des décès féminins. On est donc conduit à supposer qu'elle doit être attribuée à une immigration notable dans laquelle le sexe masculin figure pour une plus forte part que le sexe féminin.

“Quant à la cause générale et fondamentale de la prédominance du sexe féminin dans la presque totalité des populations de l'Europe, on sait qu'elle doit être attribuée à un plus grand nombre de décès masculins que de décès féminins. Cette différence de mortalité, comme nous l'établirons plus loin, est due autant à une moindre vitalité congéniale des individus mâles qu'à la nature de leurs occupations, qui les exposent à un plus grand nombre de chances de décès que les femmes.”

It has been previously noticed that in the extreme south of Europe recent enumerations discover the numbers of the two sexes to vary in a different manner, and to a different extent, than has been noted by M. Legeyt in his observations based on the enumerations of Northern or Mid-European countries. In drawing up the report

* Portugal, Etats sardes, France, Angleterre, Belgique, Suisse, Hollande, Autriche, Saxe, Wurtemberg, Bavière, Hanovre, Danemark, Suède, Norvège.

In Bajegarih the females exceed the males by 492, and the excess is more than explained by the following castes:—

Kahárs,	116 females in excess.
Halwáís,	82 ditto.
Lohars,	81 ditto.
Kurmees,	80 ditto.
Malláhs,	84 ditto.
Dhobis,	53 ditto.
Bharbunjahs,	51 ditto.
			547	

In Barhar the excess of females (313) is more than accounted for below:—

Brahmans,	16 females in excess.
Rajpoots,	106 ditto.
Kahárs,	116 ditto.
Malláhs,	84 ditto.
Kurmees,	80 ditto.
Dhobis,	61 ditto.
Gonds,	30 ditto.
			493	

These pergunnahs are all situated in the Mirzapore District.

70. In the Benares District there are three sub-divisions in which there is an excess of females. But in the first of these the excess is small—17 in a population of 33,000. It is only in Narwan that the preponderance of females is really noticeable. There the females exceed the males by 764, and the excess is more than accounted for thus:—

Rajpoots,	47 females in excess.
Bunnias,	98 ditto.
Chamárs,	136 ditto.
Kahárs,	131 ditto.
Kandus,	65 ditto.
Kalwars,	56 ditto.
Kisáns,	56 ditto.
Bhaes,	43 ditto.
Kaiáths,	40 ditto.
Hajjáms,	41 ditto.
Telis,	34 ditto.
Gonds,	33 ditto.
Koormeas,	18 ditto.
Lohars,	12 ditto.
			810	

In Barah the excess of 51 is evidently due to the absence of men of the boating caste (Malláhs), there being a preponderance of 105 females in that caste.

71. There appears, then, to be no genuine case among the Hindoo population in these Provinces in any locality except the Himalayas where the females recorded are in excess of the males.

72. But it is altogether another matter when we come to consider whether in any locality the females *existing* actually outnumber the males, or approach to an equality with them.

73. We are not on this occasion without the means of forming conclusions on this subject from the Census Tables themselves. In this respect we are more advantageously

situated than at the previous enumeration. In the caste statements appended to this report the sexes have been distinguished. This was not the case in the statements of 1865, where the numbers of the different castes are shown without any distinction of the sexes. We are thus enabled, by a reference to Statement V., to ascertain whether in any special castes, and in what castes, the males and females are nearly equal in number, and the cases where the females exceed the males.

74. It is evident that if we find particular castes in which the inequality of the sexes—hitherto so remarkable a feature of Upper Indian enumerations—does not exist, and these castes do not differ in their social habits in regard to early marriage,—on the effect of which, in producing a larger number of male births, stress was laid in the Report of 1865,—then, the climatic influences being the same, the inequality of the sexes could not be attributed to the operation of the physiological laws, depending on the disproportion in the ages of husband and wife and the early age at which girls are married in this country. Either the unfavourable influence on earlier female life, found in the practice of female infanticide, must be the cause of the inequality, or there must be influences at work to produce this inequality other than those already alluded to—viz., 1st, climate: 2nd, physiological laws depending on early marriages and the youth of Indian wives when first married; 3rd, female infanticide.

Lastly, there is another solution to the problem,—the inequality may not exist except in our Census returns.

75. The caste statement (V.) displays several instances of females being in excess of the males; and in the subjoined abstract (L.VI.) will be found thirty-nine cases where, in a particular caste in a district, the inequality of the sexes either does not exist or where the males are fewer in number than the females. I have taken care to omit from this abstract all instances where the caste is so small in numbers as to permit of no conclusions on one side or the other, having selected only those cases where the caste numbers more than 2,000:—

TABLE LVI.

Rates in which Females exceed the Males when the number of the caste is not less than 2,000.

Name of Caste.	Males.	Females.	Name of District.
Arākh,	17,652	17,323	Allahabad.
Barhai,	1,529	1,548	Mirzapore.
Bāri,	1,006	1,037	Benares.
Bhāts,	1,083	1,093	Jaloun.
Ditto,	1,779	1,520	Futtehpore.
Ditto,	2,879	3,054	Allahabad.
Bhatīārā,	1,365	2,100	Mirzapore.
Chamār,	48,648	50,678	Banda.
Ditto,	41,519	41,751	Benares.
Darzi,	1,620	1,633	Humceerpore.
Dūsādd,	2,688	3,192	Mirzapore.
Ditto,	2,074	2,110	Benares.
Hajjām,	7,637	7,703	Mirzapore.
Ditto,	4,803	4,917	Benares.
Halwāi,	1,031	1,131	Banda.
Kachhī,	11,306	11,429	Banda.
Kahār,	1,851	1,858	Futtehpore.
Ditto,	6,229	6,531	Banda.
Ditto,	5,707	5,722	Humceerpore.
Ditto,	8,357	9,010	Mirzapore.
Ditto,	7,015	7,511	Ghazceerpore.
Kalāl,	9,256	9,259	Mirzapore.
Ditto,	11,101	12,172	Ghazceerpore.
Kamanggar,	15,446	15,543	Benares District.
Kaist or Kniath,	7,333	7,436	Benares.
Kharwār,	5,170	5,224	Mirzapore.
Khatfk,	2,080	2,106	Benares.
Khatttri,	1,016	1,024	Furruckabad.
Malī,	1,073	1,111	Humceerpore.
Mallāh,	21,261	21,793	Allahabad.
Ditto,	11,660	13,362	Ghazceerpore.
Nats,	1,375	1,469	Meerut Division.
Ditto,	4,633	4,666	Rohilkhand ditto.
Ditto,	1,065	1,134	Allahabad ditto.
Ramaia,	976	1,855	Bijnour District.
Riwāri,	945	1,095	Province.
Tamoli,	1,485	1,680	Humceerpore District.
Tarkhār,	1,330	1,503	Province.
Teli,	12,349	12,550	Allahabad District.

76. The total number of persons noted in this abstract exceeds half a million (585,959), and in this section of the population the females outnumber the males in the proportion of 1,036 to 1,000.

77. The castes in which we find this, for Upper India an exceptional state of things, are 26 in number, and most of them rank low in social position. In three the professions generally followed are such as to account for an absence from home of some of the males; and in a fourth, the Bhatíára caste, it is rather a misnomer to describe what is an occupation open to every one, and often followed by women of loose character, by the generic term caste. The reader may, therefore, omit from consideration the Malláhs or boating caste; Ráwáris, who hire out camels, and with their animals are employed in conveying merchandize or travellers to and fro; Ramaias, a pedlar caste, the men of which are constantly on the move, and the inn-keeping caste, the Bhatíáras.

78. There still, however, remains a sufficiently large number of castes and persons to draw conclusions from. The four castes excluded number 76,412 persons, of whom 36,207 are males and 40,205 are females, leaving 509,547 persons (males 251,561, females 257,986), among whom the sexes are so distributed that to every 1,000 males there are 1,025 females.

79. In addition to these there are other castes comprising a large number of persons in which the males do not at all outnumber the females to the extent noticeable generally. For instance, the Kurmees of Mirzapore, famous as good cultivators, where out of 51,221 persons of both sexes the females are in a minority of only 11; or, again, the Binds, throughout the Benares Division, where in 53,012 persons of both sexes the males are to the females as 1,037 to 1,000.

80. I have made inquiries in regard to the marriage customs of these castes, which, without being conclusive as regard to their habits in this respect, go to show that, except with the Naths and Kaiaths, the age at which males and females of the other selected castes marry is much the same as in the case of the higher castes. If any difference exists, it is said to be the younger age at which the children of the Chamárs marry. Accepting it as a fact that the Telís and Arákhs of Allahabad, the Kamanggars, Dúsádds, and Hajjáms of Benares, or the Kaláls of Mirzapore and Ghazeepore, together with other castes noted in Table L.VI., do not differ from higher castes in regard to the age at which their children marry, there are here, I think, sufficient data to throw doubt on the probability of early marriages, where the husband is more mature than the wife, exercising such material influence on the sex of the offspring as to result in a greatly disproportionate number of male births.

81. Leaving out of consideration possible climatic influences on the population of male to female births, I feel myself driven to one of two conclusions. Either the vast disparity between the sexes noticeable at each successive enumeration in this province is a fact, and if so, is in the main attributable to female infanticide, and to disregard generally of female life, or it is not either wholly or in part the fact, and is due to a persistent concealment of females.

82. The conclusion that this disparity of the sexes does not at all exist except on paper may be put out of sight at once. To what extent, if any, it is apparent rather than real, is a question I shall endeavour to answer later on in this Report. How far it is attributable to female infanticide we have not as yet sufficiently full information to decide, but the extreme magnitude and wide diffusion of this horrible crime are slowly and laboriously being brought to light by the official inquiries made with a view to the application of the Infanticide Act. The persistent efforts of Sir William Muir and his district officials are reaping their reward. Gradually and surely the minute inquiries which are being made into the condition of the various tribes by whom the crime is practised, and the localities where it exists, are permitting the introduction of a repressive system, which we may honestly believe will finally trample out the existence as a tribal custom of this hideous offence.

83. The wide extent to which it prevails, and its effects on the disparity of the sexes,* may in some measure be traced in the district reports on the subject. In those official records is gradually being mapped out to the startled gaze of the public the wide area, both local and tribal, over which the crime extends; and the Supplement to the *North-Western Provinces Gazette* for October 4th contains one of the most recent disclosures in regard to its extent. It is not, however, a part of my duty to quote from the official literature concerning this dreadful practice; and, as I believe the local reports on infanticide in the various districts of these Provinces either have been or will be published for general information, I quit this topic without regret, merely calling attention to the fact that the disparity in the sexes prevails much more largely towards the northern and western portion of the Province, and diminishes, as it does in Oudh, as the south-eastern districts are approached. This similarity between Oudh and the North-West is noticeable.

84. In the statements classifying the ages of the people, which I am about to discuss, it is possible we may be able to discover if there is reason to consider that, in addition to the disparity between the sexes occasioned by female infanticide, any part of the disproportion between the sexes is occasioned by concealment, and so far is apparent rather than real. The disproportion in this Province compared with Bengal and European States, may be thus stated:—To every 10,000 females in the North-West Provinces, there are 11,424 males—against 10,037 males in Bengal, against 9,845 males in the average of 15 European countries, against 10,707 in Greece, and 10,029 males in Italy.

VII.—Ages of the People.

85. The feature which most prominently distinguishes the present enumeration from its predecessors here or in other Indian Provinces, is the attempt which has on this occasion been made to classify the ages of the population. The great importance of information on this head cannot be over-estimated in connection with all inquiries relating to the physical well-being of the people. To take only one instance of its bearings on such inquiries, it is impossible to ascertain what is the average duration of life in a particular country without statistics in regard to the ages of its inhabitants. It is obvious to the most careless observer that, all other circumstances being the same, the material condition of that population where the average duration of life is thirty-five or forty, or any higher figure, is immeasurably better than is the material condition of a people whose average space of life is twenty-two or twenty-five. It has been remarked by one of the foremost statisticians in Europe:—"Les populations les plus robustes, les plus vigoureuses, et par conséquent placées dans la meilleures conditions économiques, sont celles qui comptent le plus d'adultes, un plus grand nombre d'enfants parvenant à la maturité." We are now for the first time in a condition to test the position of the population of this Province by this criterion.

86. In the Census of 1865, the population was distinguished as adults and minors, those below 12 years of age being taken as minors, and those above 12 being classed as adults. Such a distinction was extremely rude and imperfect; but it was the best we were in a position to adopt, and in regard to females it was perhaps the most convenient that could be made. In Oudh in 1869, in the Punjab in 1868, and in Bengal in 1872,† a similar distinction was drawn, and some insight was then obtained into the condition of the people viewed from this point. But such a distinction, without absolute certainty as to the accuracy of the figures, was quite insufficient to permit of any broad deductions.

* In the Meerut District I found in one village unsuspected of infanticide, and in one tribe in that village, which, though suspected as a tribe, was not in this case thought to practise the crime, there were out of 88 children under 12 only 8 girls to 80 boys !!!

† In the Berars, of which a Census was taken in 1867, the line of demarcation between adults and minors was fixed at 13 years, and in the Central Provinces, in the Census of 1866, at 14 years. Though no correct comparison could, therefore, be made between the figures obtained on those occasions with the results arrived at in the North-Western Provinces in 1865, it is possible now to compare the figures for the Central Provinces and Berar with the figures for the North-West in 1872. An error into which the compiler of the Berar report has fallen, in comparing the Berar figures with those for the North-West Provinces in 1865, has been pointed out in the Oudh Report.

87. In all these cases one result came out prominently. If the distinction of age had been accurately maintained, it was evident that the number of children was greatly in excess of that found at the same term of life in any European population for which statistics were available. The results shown are as follows:—

TABLE M.
Number of Children under 12 in one thousand of

		Total population.	Male population.	Female population.
North-Western Provinces, 1865,	...	356	370	339
Punjab,	355	353	356
Oudh,	360	376	342
Bengal,	345	375	315
North-Western Provinces, 1872,	...	331	339	323

88. These were so opposed to European experience, and yet if correct pointed to so fearful a waste of life, that in the report for 1865, being without other corroborative testimony as to the accuracy of the figures, I remarked,—“The large proportion of children under twelve in the total population in these Provinces would indicate a waste of life in later years, which I am not prepared to believe in until we have further information on this subject.”

89. The further information we were then in want of we now possess, and the details of age afford a valuable criterion for testing the correctness of the numbers of children and adults.

90. Before entering into any examination of the details of age, as disclosed in Statements II.A. and B. of this volume, and throughout the several abstracts in Vol. II., I would draw attention to the accompanying Tables. M.I. and M.II., which have been drawn up to permit of a comparison between the returns of 1865 and 1872 in regard to the number of children under 12 shown in them. Considering the greater precision with which the separation of the two classes of adults and minors can be made from returns which go minutely into the ages of the younger part of the population—and, on the other hand, looking at the indistinct line of demarcation which would probably be maintained by a suspicious inaccurate race when replying to the question, Is your child above or below 12 years of age?—it appears to me the general resemblance between the returns of 1865 and 1872 is a strong indirect proof of their accuracy. When it is also remembered that, in the classification of 1865, children of the full age of 12 would often be included in the minor class, while in the present returns they are generally excluded, the persistent excess in the figures of 1856 is possibly accounted for.

TABLE M.I.

91. I pass now to a consideration of the details of ages shown in the general Statements II.A., II.B., and in Vol. II.

It was with many misgivings as to the results that the attempt was made to enumerate the population by age.

In many quarters the opinion was held that no valuable data could be obtained in regard to the ages of a population which was notoriously inaccurate in replying to questions about their age. In some cases the propriety of asking for such information from a suspicious people was questioned. But whatever may be the inaccuracies of an ill-educated people in regard to their ages at the middle and later terms of life, there was no reason to suppose the ages of the more juvenile portion of the community would not be given in a fairly correct shape, and it is the ages of the younger portion of the community that it is most important to know. No mother can be fonder of her children than are Indian mothers of their boys. For all practical purposes they are able—and are not, I think, unwilling—to give accurate information in regard to the ages of their younger children. The horoscope that is cast for every little Hindoo soon after he enters the world would alone suffice for the collection of trustworthy information in regard to the ages of the children, both male and female. Possibly there may be less accuracy in the case of the elder female children, but even in their case correct information, that is, sufficiently correct for the purpose, can be obtained for the first five or ten years of their existence.

From a very careful examination of the returns under the head of age, I have come to the conclusion that anticipations of general inaccuracy, at all events in the first decade of life, have proved groundless; and that we have obtained in Vol. II., and in Statements II.A., B., a valuable addition to our information in regard to the material well-being of the people. There are unquestionably mistakes and inaccuracies even in the earlier ages,—inaccuracies sometimes occasioned by errors of the people, sometimes by errors of the enumerators, and sometimes by errors of the copyist who condensed the original returns. Instances of such mistakes have been detected, but they have not been frequent; and I believe the figures in regard to age may be accepted as sufficiently correct to allow of certain large deductions being made from them. If so, the great labour that has been expended in this direction will not have been thrown away.

Statements II.A. and II.B., which have been drawn up in the form prescribed by the Supreme Government, classify the ages of the population of either sex, distinguishing creeds, in the following nine terms of life:—0 to 1; above 1 and not exceeding 6; above 6 and not exceeding 12; from 12 to 20; and then in four successive decennial terms up to 60, concluding with a ninth class, comprising all above 60 years of age.

The classification thus adopted is convenient for a comparison of present with former Indian figures of the ages of the people, but it is faulty when comparisons with European figures are attempted. To remedy this defect, the accompanying abstracts M.III. have been prepared. They show for each district and each division of the Province, and, lastly, for the entire Province, the number of the population of both sexes—whether male or female—classified in quinquennial periods up to 15; and in paralleled columns have been added the percentages borne by these different classes on the total population of all ages of the same description.

92. Looking to these abstracts, we find that, while there are in England 351 children of both sexes in every 1,000 of the population, in this Province there are 382. Taking each of the first three quinquennial periods separately, it appears that, while in England there are 134 children of both sexes between 0 to 5, here there are 165. Between 5 to 10 this Province still shows an excess over England, the figures being for the North-West Provinces 126 against 116 in England. In the 3rd period there is a falling off, the figures for England being 101 against 91 in the North-West Provinces. If we go on with the examination we see the population of both sexes between 15 to 20 is considerably above the number in England for the same term, the figures for the Province being 111 against 96 in England; and again, between 20 to 30, and 30 to 40, the figures for the North-West Provinces are steadily higher than those for England. Now, if we turn to the decennial period 10 to 20, we find that in both sexes the number of individuals in every 1,000 is higher out here than in England; but while the male population here maintains this excess at this period of life, the female population shows a much less proportion of women between 10 to 20 than is to be found at the same age in England. The figures are given below, and at the same time the proportions for the French and Austrian populations have been added for the sake of future comparisons which it may be necessary to make:—

TABLE M.IV.
Age proportions in Quinquennial and Decennial periods.

			0 to 5.	5 to 10.	10 to 15.	15 to 20.	20 to 30.	30 to 40.	40 to 50.	50 to 60.	60 upwards.
ENGLAND.	Both sexes,	...	134	116	104	96	169	130	102	70	64

	Females,	...	170	118	79	111	204	146	91	52	29

Number of Persons between 10 and 20 in every 1,000 of the same sex.

	England.	N.-W. Provinces.	Austria.	France.
Both sexes, ...	200	202	192	170
Males, ...	201	213	194	175
Females, ...	197	190	191	167

93. Turning then, as our attention is thus directed, to the proportions which the two sexes bear at different terms of age to the total population of the same sex, we at once notice a variation so remarkable as to demand careful scrutiny. We see that in every 1,000 of the population there are, between 0 and 5, 161 boys to 170 girls; between 5 and 10 there are 132 boys to 118 girls; but between 10 and 15, there are 102 boys to 79 girls.

94. Now, reasoning from European experiences, we should expect to find a smaller proportion of female children than of male in the first fifteen years of life; but as female life is better than male life, and compared with the other sex the prospect of female life goes on steadily improving through the higher years, we should also expect to find the difference less marked in each of the succeeding three periods. We

find in this Province that quite the reverse is the case in regard to the latter anticipation. More girls proportionately are found in the first period than boys at the same age. They fall at once in the second period, and in the third period the diminution is even more marked. I am inclined to believe, apart from errors in the ages given, that we are not far here from a clue to the labyrinth into which our figures in previous enumerations, as well as on this occasion, have led us.

95. It seems to me that there has been uniform concealment of females between the ages of 10 and 13—ages when the natives would perhaps desire to keep their females more in the background than usual. It is possible the concealment may go further back to even yet earlier years than ten, but it certainly does not seem to have affected the figures below six or even higher. Now, we know also that one of the errors most commonly noticed was the omission to enter in the enumerator's return girls who had not as yet gone to their husband's homes. It may be said, however, that the general opinion expressed by all District Officers in regard to the comparative accuracy of the returns militates very strongly against such a supposition, and that the cause of the small number of females disclosed in the returns between the ages of 10 and 15 must be looked for elsewhere. It will be said probably that the females have been recorded, but their ages have been overstated. To examine into this matter, I have had various abstracts drawn up, and a large number of percentages prepared. It will not be necessary to burden this report, which already bristles with figures, with all of these tabular statements, but I shall add certain tables which will, I think, enable those who desire to pursue the enquiry to the end to do so with facility.

96. Now, proceeding on the assumption that the figures are correct in regard to the absolute number of females of all ages recorded, I think we may take it that one or other of the following causes only can be assigned as producing the great falling-off in the proportion of girls on female population, as compared with the proportion of boys on the male population, in the years from 10 to 15. Either the ages of the girls have been understated at this term of life, or they have been overstated, or both causes conjointly have been at work to produce the marked diminution I have referred to. In either of these events we should find the falling-off at this particular term, 10 to 15, recouped by a corresponding increase either in the term immediately preceding or in that immediately succeeding the limit 10 to 15. A glance at the figures will show this is not the case.

97. The absence of females in the term of life which may be called for these Provinces the nubile age is made more conspicuous if the decennial term 10 to 20 be divided into two unequal portions, the former comprising all girls between 10 and 13 the latter between 13 and 20. To enable the reader to judge of this, I append a table in which the percentage of males and females in these terms of life on the total of their respective sexes is shown for children between 10 and 13, and for adolescents from 13 to 20; and the two great religious sections of the community have been separately distinguished;—

98. It will be seen from this that the proportion borne by males between 10 and 20, and by females in the same term of life, to the total of their respective sexes generally approximates very closely, but in the three years between 10 and 13 this is not the case, the proportion of girls to total females falling considerably below the proportion borne by boys of the same age to total male population.

99. This defect is not fully made up in the subsequent seven years. It must also be kept in view that, according to ordinary laws, and there is no reason to suppose India is exceptional in this case, the females should go on increasing in numbers over males at the same term of life throughout all the years of life after the period I have taken. We find, then, throughout the Province a difference of 137 in the Hindoos and of 141 among the Mahomedans in the term 10 to 13, in the proportions borne by males of that age to total males and by females of that age to total females. In the period 13 to 20 the Hindoos have gained back 37, and the Mahomedans 36, of this difference, leaving a considerable balance still unaccounted for.

100. My impression, after a very careful study of these figures and those in other tables, is entirely against the assumption I have started with, *viz.*, that the numbers of the females have been accurately given though their ages have been misstated. I incline altogether to the other view, that there is a portion of the females between 10 and 15, or perhaps between 8 and 15, who have escaped the enumerators, and that the actual disproportion between the sexes, though it probably exists to some extent—to what extent it is impossible to say—is not so great as it has hitherto been portrayed.

Further, I think there is very good ground for the conclusion that the disparity does exist, and is mainly caused by female infanticide. Whether there are so many more male births than female births to account for any portion of the disparity we are not at present in a position to assert.

101. The question of the accuracy with which females of a particular age have been recorded in the Census Return fades into comparative insignificance by the side of the subject I now approach,—the material condition of the people as illustrated by the Age Statements. It is an undisputed fact that, with certain information as to the particular ages of a large number of people, the average duration of life in that population can be fixed within limits which are narrow enough for all practical purposes.

102. At the last Census the number of children recorded was so high—that is, it bore so high a proportion to the total population—that, though admitting the higher rate of mortality likely to prevail in a country such as this, I refused to follow up the clue then presented. It is now necessary to do this, as we have sufficient data to form fairly truthful conclusions.

103. In making comparisons with European countries, it has generally been the practice to take English statistics as a standard for Upper India. I fear that in this case they would completely mislead. The duration of life in England is singularly favourable, even in the abstract which I append, and, since the period for which the figures in it were taken its position in this respect has improved still further. In Table M.VI. it stands fifth in a list of eleven countries. The four kingdoms immediately preceding it have none of them a population approaching in number to England:—

T A B L E M.VI.

Italy,	730,690	368,891	361,799	Estimated to middle of 1863,	1 year, 1863, ..	199,712	108,760	90,952	27.83	29.48	25.14	22,047,034	11,033,245	11,013,789

106. In the subjoined abstract are given—for Italy, England, and the North Western Provinces—the number per 1,000 persons of children at the ages 0 to 1, 1 to 3, and 3 to 5, enumerated in those countries at the Census:—

*Proportion of Children in every 1,000 persons of both sexes, in every 1,000 males and in every 1,000 females.**

		Italy.			North-Western Provinces.			England.		
		Both sexes.	Males.	Females.	Both sexes.	Males.	Females.	Both sexes.	Males.	Females.
0 to 1,	...	331	314	328	459	447	473	225	301	287
1 to 3,	...	576	582	571	579	546	616	537	553	523
3 to 5,	...	419	413	416	613	619	607	512	528	497

107. These tables present to view a state of things in Italy which I fear has its counterpart here. We see a country with a population in which males slightly exceed the females, with a high birth-rate, and with a higher rate of infant mortality and a lower average duration of life than any other country in Europe for which we have figures, except Austria and Russia, where the average duration of life is even shorter apparently than in Italy. In these circumstances, we find the proportion borne by children in these periods of life—between 1 and 5—on the total population of the same sex in Italy, to be exceeded in each instance by the proportion borne by the same sex in the same term of life in this Province. There is no reason to think that in the first two of these periods (whatever errors there may be in the later period, and in this last period I believe we are very close to accuracy,) there has been any such general error as could take away the meaning of these figures. I fear there is but one conclusion to be arrived at, if we are prepared to accept as correct these age figures for the earlier terms of life in this Province. As I have already indicated, I believe these figures are so far correct that we may accept them as a given basis for deductions.

108. In the Meerut District great care was taken to enumerate the ages of the infant population: and in the abstract given below (M.IX.), the number of infants of either sex, and of both sexes together, for each of the following terms, 0 to 1 and 1 to 2, has been recorded pergunnah by pergunnah:—

TABLE MIX.

Statement showing Children from 0 to 1, and from 1 to less than 2 years, for the pergunnahs of the Meerut District.

Names of Pergunnahs.				MALES.			FEMALES.

* The high figures borne by the child population in Bengal and Oudh, in the Punjab and Berar, all seem to indicate the low average duration of life in those provinces. It is probable that the variation noticed by Mr. Beverley in paras. 396 to 411 may find an explanation in the low average prospect of life of the aboriginal tribes.

This table has been prepared because there is reason to think that in the age statements from other districts the line of demarcation at the first year of life has not been strictly maintained, and that in some cases children above one year have been included in the term 0 to 1.

109. As in the Meerut District the children under one year have been distinguished from those exactly one, and those who have been entered in the original returns as above one but not exceeding two, and as the Meerut population exceeds one million and a quarter, and is a fair instance of a mixed population of Hindoos and Mahomedans, I have extracted the above figures as offering some guide to the actual numbers of children from 0 to 1 that may be found in an ordinary North-West district. It is not likely that, with the class of enumerators at present employed, the numbers of children exactly below one year of age will ever be given with precision. To obtain precise results in this direction, it would be necessary to enquire from each parent the age of his child at its last birth-day,—a course we are not at present in a position to adopt. Judging, however, by the Meerut figures, it would appear that the enumeration of infants from 0 to 1 has been effected with a considerable degree of accuracy. The proportion borne by infants at this term of life to the total population of both sexes—male or female—per 10,000 is shown below for Meerut, England, France, and Austria :—

Name of place.	Year of Census.	Both sexes.	Males.	Females.
Meerut, ...	1872	2,919	2,890	2,948
England, ...	1861	2,935	2,997	2,874
France, ...	1861	2,168	2,211	2,125
Austria, ...	1870	3,331	3,394	3,270

110. At first sight it may be said the figures for this district show a proportion which assimilates more closely to the English numbers than to the Italian for at all events the first year of life. This is certainly the case ; but, taking into consideration the high figures given for the quinquennial period 0 to 5, I consider we are justified in accepting it as a fact that the average duration of life in this country is very much lower—lower to an extent which has not as yet been noticed in public records—than is the duration of life in England. And further than this, it may, I think, be said the Italian average duration is nearly approached in this Province.

111. Elliottson says*—"The average life of all ranks in the peninsula of India falls one-eighth below what it is in Europe, and the sixtieth year is seldom attained there."† Now, the average of the duration of life in the seven countries, England, France, Holland, Prussia, Italy, Spain, and Russia, is a little below 35 years. If, therefore, Elliottson is correct, and India is one-eighth below the average, we get a mean duration of life of 30 years and 8 months, or a term shorter by a year and two months than is the average duration of life in Italy.

112. Nor are we without further evidence which to some may be more conclusive than these figures. The returns of deaths in this Province are undoubtedly incorrect, but it is equally true that the error lies on the side of under-statement rather than over-statement. Now, there are circles in the Sanitary Commissioner's jurisdiction which show excessively high rates of mortality, and yet these are not conspicuous or remarkable for greater sickness or for a larger actual number of deaths than neighbouring

* *Human Physiology*, page 1,038, quoted in Buckle's posthumous work.

† In Appendix D. will be found for Meerut the ages above sixty recorded in that district. It is curious to notice there how the more epochal years—70, 75, 80, 85, 90, 100—are marked out from the less easily remembered intermediate years. For instance, there are 32 individuals who have recorded their ages as 100, one who has given his age at 105, and two at 110 ; but not one person appears in any of the intervening years. I notice exactly the same feature in the Austrian returns.

places where the recorded mortality—whatever the actual mortality may be—is extremely and ridiculously low.

113. The accompanying figures, extracted from the Sanitary Commissioner's Report for 1871, will throw some light on the mortality of the country :—

TABLE XIX.

Showing Rural Circles in the North-Western Provinces in which the Rate of Mortality is higher than 30·5 per 1,000.

1.	2.	3.	4.
District.	Name of Circle.	Population according to Census of 1865.	Ratio of deaths per 1,000 of the population.
Guthwal,	Selee,	5,740	30·66
	Kunderpore,	5,780	37·51

Jhansie,	Pooch,	7,150	36·64

Here it will be seen there are no less than 70 instances where the death-rate is higher than the average death-rate in Italy. In some cases it is enormously high. Now, the whole of these instances relate to a purely rural population. I have been careful to omit all the town circles recorded in Dr. Planck's report, and have confined my selection to those rural circles where the death-rate exceeds the Italian average.

114. It is not in my province to indicate the causes of the high rate of mortality which I believe to be prevalent here. If it at all approaches the death-rate in Italy, and the figures I have quoted tend to this conclusion, there is room for an immense amount of improvement in the material well-being of the people. But there are some circumstances which are patent to every observer who has looked at all into the condition of the people. I would specially notice the nature of their food, its insufficiency, the great changes of temperature acting upon people who wear but little in the hot weather and are (the poorest of them) much under-clad in the cold weather,* and last, but not least, the extent to which fever and other forms of sickness prevail towards the close of the rains and commencement of the cold weather, together with the small-pox that periodically ravages the country at an earlier season of the year.

VIII.—Number of Insanes, Idiots, Deaf and Dumb, and Blind, and Lepers in the Population.

THERE is a statement following II.A. and II.B., which throws considerable additional light on the condition of the people. I refer to No. I.C., in which are shown the number of insanes, idiots, deaf and dumb, blind, and lepers. These statistics require to be dealt with by a scientific man. I have been fortunate in obtaining the aid of Dr. Cleghorn, who has kindly examined the returns, and recorded his remarks on the figures they contain. I append his very interesting memorandum:—

“Dated 25th October, 1873.

“From—JAMES CLEGHORN, ESQ., M. D., Assistant Civil Surgeon, Allahabad,

“To—W. C. PLOWDEN, ESQ., In Charge of Census.

“I HAVE the honour to submit the following observations, in reply to your letter No. 3284, dated 12th August last, regarding the statistics of infirmities collected at the late Census of the North-West Provinces.

“*I.—Insanes.*—These must be considered along with the idiots, as it was impossible for the enumerators to have distinguished between the two classes.

“*(a)* In the whole Province there are 4,801 insanes (including idiots), of whom 3,443 are males and 1,358 females, being in the proportion of one in every 6,408 of the total population; and by sexes, one male in every 4,765, and one female in every 10,576. In Lower Bengal, according to the Census returns recently published, the ratio is one in every 3,260 of the population; and by sexes, one male in every 2,135, and one female in every 6,917.

“*(b)* In France (1861) there is one insane (including idiots and cretins) in every 443 of the population,—the proportion in males and females being one in 425 and one is 463 respectively.

“*(c)* In England and Wales there is one insane (including idiots) in every 522 of the population.

“In Scotland the proportion is one in 344.

“In America one in 443.

“And in Norway one in 551.

} From Bucknill and Tuke's work on Psychology.

* One of the most painful sights that presents itself to a District Officer in his early morning ride in the interior of the district in the cold weather is the crowd of little wretched children and women who are huddled up, shivering, against some friendly bank where they can get the full blaze of the sun.

“(d) The great difference in the number of insanes in the North-Western Provinces, as compared with European countries, can be partly explained by the difficulties attending the collection of correct information on such a subject, without a thoroughly competent staff of agents, among an ignorant and superstitious people widely scattered over a large extent of country, and also the inability of the enumerators to recognize the less marked cases of insanity. Seclusion of the females among the better classes, and the great dislike shown by all to speak of their female relatives, may be considered a sufficient reason for the disparity in the number of insanes and other infirmities in the two sexes.

“(e) Making, however, due allowance for all errors of enumeration, it must, I think, be accepted as a fact that the percentage of insanes in the North-Western Provinces, and India generally, is much below that of European countries. This, I think, can be accounted for, without the necessity of fabricating a theory to suit the figures, by simply comparing the causes at work in the North-Western Provinces with those in European countries. It is an accepted truth in psychology that, the higher the state of our present so-called civilization, the greater the tendency to insanity: not perhaps as a consequence of civilization, but of the evils which up to the present time have accompanied it. In highly-civilized countries the brain of man readily responds to, and is easily excited by, external impressions, and we find that fear, grief, remorse, domestic troubles, disappointments in love, ambition, and wealth, with the excitement of great religious revivals and political commotions, are credited by such great authorities as Pinel and Esquirol as the causes of insanity in 60 to 66 per cent. of the patients treated in European asylums. Such causes, should they ever arise, have but little permanent effect on the mind of the native of these provinces. His emotional and intellectual faculties are as yet undeveloped, and his mental troubles are almost entirely due to domestic causes. Only two asylums, that of Bareilly and Benares, exist in the North-Western Provinces for the treatment of lunatics. The returns from them, published in the ‘Selections from the Records of Government,’ show the causes of insanity in the total treated, and not of the yearly admissions, so that the statistics for one year only can be taken. The numbers are much too small for comparison with European figures, but they may be quoted to show the greater influence of the physical over the moral causes in producing insanity in these Provinces. Six hundred and two patients were treated in these asylums during the year 1868, and of 252 of these in whom the cause of the mental affection was ascertained 213, or 84·5 per cent., were attributed to physical causes, and only 39, or 15·5 per cent., to moral ones. I may remark here that the fact of two small asylums being found sufficient for the requirements of a province with a population of nearly thirty-one millions, ruled by a Government who, judging by the great number of institutions it has established for the relief of physical ailments, would be equally ready to provide proper accommodation and treatment for the mentally afflicted if occasion required, shows that there are but few insanes in the province.

“(f) The great prevalence of intemperance among European nations leads to a greater number of cases of insanity than all the other physical causes combined. Dr. Carpenter, in his work on ‘Human Physiology,’ states—‘That it is perfectly well known to those who are conversant with insanity that of all the “predisposing causes” of that disorder, habits of intemperance on the part of either or both parents are among the most frequent.’ I need hardly say that the taste for alcohol has as yet made but little progress among the natives of the North-Western Provinces, and that the cases of insanity from its abuse are but few. Of the 252 cases treated in the local asylums during 1868 in whom the cause was ascertained, only 13 were ascribed to the excessive use of ardent spirits; but in the same cases, 126, or 50 per cent., were attributed to the different preparations of Indian hemp. This drug has a powerful effect on the brain, and it is a fortunate circumstance that its use is limited, as the majority of those who indulge in it fall victims to its baneful effects. Opium-eating is a common habit among the Mahomedan population, but, although the prolonged use of the drug may lead to serious changes in the functions of animal life, it does not appear to have any lasting

deleterious effects on the brain. Among the Chinese, who are much addicted to the use of opium, insanity is almost unknown, and is hardly noticed in their medical works. It is, I understand, rather a common practice here in India for mothers to give opium to their children very soon after birth. In a case I lately observed as much as three grains of the drug were given daily to an infant aged eight months.

“(g) Of the other physical causes of insanity, the chief are uterine disorders, marriages of consanguinity, and epilepsy. Judging from dispensary and lock-hospital experience, I should say that the women of this country, in common with those of other semi-civilized countries, are particularly free from affections of the uterus. Parturition in them is easy, and is seldom followed by the complications to which the civilized woman is liable. Catamenial disturbances, and the changes that take place at the different critical periods of life, are well borne, and hysterical symptoms but rarely become developed.

“(h) Enforced widowhood being peculiar to India, may be mentioned as a likely cause of mental derangement in individuals of a nervous temperament.

“(i) *Marriages of consanguinity*.—Among the higher castes ‘exogamy,’ or marrying out of the tribe, is strictly observed, and even among the lower castes marriage of blood relations is rarely or never permitted. We may, therefore, conclude that the nervous system of the people of the North-Western Provinces has not suffered deterioration by breeding in and in, the result of which Maudsley says, ‘is to produce barrenness and sterility, children of a low degree of viability, and of imperfect mental and physical development, deaf-mutism, and actual imbecility or idiocy.’

“(j) Epilepsy is closely allied to insanity, and can hardly be considered as a cause. Niemeyer, a German author, writing I conclude of his own country, states that there are six epileptics in every one thousand of the population. Though by no means a rare affection in the North-Western Provinces, the number, I suspect, are few when compared with the above, and it is generally met with as a complication of insanity. Of the 252 cases of mental affections previously noticed as having been treated in the Bareilly and Benares Asylums in 1868, 37 were said to have been caused by epilepsy.

“(k) Starvation as a cause of insanity is not specially mentioned by English writers on the subject: it is a condition with which they are practically unacquainted. Among the peasantry and lower classes generally of the North-Western Provinces hunger is a prominent symptom; and chronic starvation, both from a deficiency in the quantity of food, and in almost an entire absence of one or more of the ingredients essential to health, is by no means of uncommon occurrence. At a distance from towns, the ordinary wage of an agricultural labourer, almost invariably a married man—I refer more particularly to the Allahabad District—is, in the ploughing season, one seer nine chittacks (equal to fifty ounces) of behjur. When digging and weeding he gets about two-thirds of the above quantity. The wife is also occasionally employed in light field work, and when so engaged she gets from twenty-five to thirty ounces of behjur. The husband in addition receives about two rupees, either in coin or its value in grain, once a year from the zemindar as a retaining-fee. The above constitutes the highest daily earnings of man and wife when in regular work; but during the hot season, and occasionally throughout the year, field hands are not required, and the family subsist on the irregular earnings of the husband while employed in repairing houses, &c., in the village. Should the husband become sick, no rare event, absolute starvation stares them in the face.

“(l) Behjur is a mixture of several grains: fifty ounces of an ordinary specimen obtained from the bazaar contained twenty-nine ounces of barley and twenty ounces of different kinds of peas, with one ounce of refuse matter. The loss in coarse husk in grinding the twenty-nine ounces of barley, calculated on the prison rate, would

be three ounces. The nutritive value of the remaining forty-six ounces of grain, calculated from the tables given in Dr. Parke's 'Manual of Hygiene,' is as follows:—

Table showing the Nutritive Value of forty-six ounces of Beljur.

				Total Weight.	Water.	Albumen.	Fat.	Starches.	Salts.
				Ounces.	Ounces.	Ounces.	Ounces.	Ounces.	Ounces.
Barley,	26	3.90	3.37	0.56	18.17	Not given.
Peas,	20	2.35	5.59	0.29	11.27	0.89
Total,				46	6.25	8.96	0.85	29.44	0.89

" I have taken fifty ounces as the average daily earnings of man and wife, as the gains of the wife are more than equalized by the losses of the husband on blank days and when only light labour at reduced rates is available.

" (m) The following table, showing the nutritive value of the diet of a male and female labouring prisoner, is given to contrast with the above:—

Diet of Male Labouring Prisoner.

Article.	Total weight.	Water.	Albumen.	Fat.	Starch.	Salts.	
	Ounces.	Ounces.	Ounces.	Ounces.	Ounces.	Ounces.	
Barley,	13.3	1.99	1.72	0.28	9.29	Not given.	
Gram,	6.7	0.75	1.48	0.24	4.16	0.17	
Parched do.,	4.0	0.45	0.90	0.15	2.52	0.09	
Dall,	4.0	0.40	0.90	0.08	2.50	0.12	Four times a week.
Oil,	0.08	0.08	Three times a week.
Salt,	0.22	0.22	
Total,	28.30	3.59	5.00	0.83	18.47	0.68	

Diet of Female Labouring Prisoner.

Article.	Total weight.	Water.	Albumen.	Fat.	Starch.	Salts.	
	Ounces.	Ounces.	Ounces.	Ounces.	Ounces.	Ounces.	
Barley,	10.66	1.59	1.38	0.23	7.55	Not given.	
Gram,	5.33	0.60	1.20	0.20	3.36	0.13	
Parched do.,	4.0	0.45	0.90	0.15	2.52	0.09	
Dall,	4.0	0.40	0.90	0.08	2.50	0.12	Four times a week.
Oil,	0.08	0.08	Three times a week.
Salt,	0.22	0.22	
Total,	24.29	3.04	4.38	0.74	15.93	0.56	
Total of both diets,	52.59	6.63	9.38	1.57	34.40	1.16	

" (n) The prison diet is just sufficient to preserve health, yet how much richer is it in all nutritive qualities than that of the free labourer. The food of the prisoner is varied from time to time: he gets eight ounces of vegetables with a modicum of oil

three times a week, and a ration of salt daily. He is besides well clothed and housed, and his surroundings are in a good sanitary condition. The free labourer and his wife, on the other hand, live on behjur from year to year, except perhaps for a month after the rainy-weather crops are reaped ; they are indifferently clothed, and they live in miserable, dark, and unventilated huts. The quantity of their food is insufficient, and to preserve its bulk, so as to satisfy their stomachs, they grind the husk and flour together. This, however, prevents them getting the full nutritive value from their meal, as the coarse particles of bran are indigestible, produce irritation of the bowels, and the food is passed through before it is properly digested. Vegetables form no part of the dietary, except perhaps in the rains, when the succulent leaves of certain plants are available. Oil is only tasted once a year, when Sitla is worshipped ; salt, in small quantities, is eaten once, twice, or three times a week. It is obtained from the bunniah in exchange for its equivalent in grain, and a man will hesitate before he deprives himself and family of food for the sake of what he considers a luxury. The salt is eaten grain by grain with each mouthful of food to tickle the palate. The skin, after a long course of such a diet, becomes harsh, dry, and discoloured, it hangs loose on the body, the belly becomes shrunk and attenuated, eyes muddy, and intellect somewhat clouded. The brain early sympathizes with the rest of the organism, and a diet of behjur prolonged throughout a man's life-time must seriously affect its integrity, and many cases must end in fatuity and imbecility. The causes of the mental affection in 350 of the 602 cases treated in the local asylums in 1868 were unknown. These are the imbecile wanderers picked up by the police, and it is among them that we must look for the cases of starvation that have ended in insanity. This would account, as explained by the able and experienced officers in charge of these asylums, for the high rate of mortality among the patients, and partly also, I think, for the very high percentage of recoveries. Insanes, before they are sent to the asylums, are kept in the district cells under the observation of the Civil Surgeon, and many of them recover by reason of the good and regular food which they obtain, without any further treatment.

“(o) The only difference in the diet of the small tenant farming five to ten beegahs of land to that of the labourer is that the supply of behjur is more regular, and perhaps more plentiful, and that salt is eaten daily or every second day. The taste of oil is unknown even to him.

“(p) I may add that in the Etawah District the diet of the poorer classes is somewhat similar to the above, but the cheaper dalls are substituted for the behjur.

“(q) The following cases, taken without selection, are recorded in illustration of the above remarks :—The body of a chumarin, aged about 20 years, was brought in for examination on the 29th September last. She had committed suicide by hanging. The husband, a young man, who had accompanied the body into the station, informed me that his wife, for three or four days previous to her death, had complained of pains in her stomach, and had told him that she could no longer nourish her child, aged six months, as her share of the daily meal was insufficient for that purpose. I enquired into his circumstances, and found that he was an agricultural labourer, and that, in addition to his wife and child, he supported an aged mother. His daily earnings when in regular employment during the whole day were twenty-five chittacks (fifty ounces) of behjur. His wife in weeding times obtained fifteen chittacks or thirty ounces of behjur. He only eats salt once in eight days, which he gets from the bunniah in exchange for a handful or two of grain : oil, spices, or vegetables he never tastes. The three grown-up people were, he says, always in a state of hunger. *Post-mortem* examination of the body of the woman showed no organic disease whatever, and the pains she complained of were no doubt due to the empty state of the stomach and intestines.

“The six bearers (chumars) who carried the body into the station told a somewhat similar tale to the above. One of them supported a wife and two children, aged respectively five and seven years, on his daily wage of fifty ounces. I asked them how

they managed in case of sickness, and they said that they starved. On the same day, while examining prisoners prior to their release from jail, I asked one of them, a young chumar, the cause of his imprisonment. He replied, stealing gram '*pet ke waste*,' i. e., for the stomach's sake. The prominent points in his domestic history were as follows :—He is the youngest of six brothers, all of whom, wonderful to relate, are alive. The eldest farms ten beegahs of land, and is assisted in the farm operations by the other brothers as occasion requires. All his brothers are married, and they have between them five children, but each is not the offspring of different parents. All the brothers, except the eldest, work as daily labourers to the zemindar when not engaged in the home holding, and their wages are fifty ounces of behjur each daily. In prosperous times the daily amount of flour cooked for the whole household, sixteen individuals, was fifteen pounds ten ounces. They never had vegetables, spices, or oil : salt in small quantities occasionally. This youth had been in jail on two occasions for stealing grain from the fields.

“ A man in a higher position of life to the above says he eats oil once a week, and salt daily.

“ A chumar, aged about 40 years, was admitted into jail on 4th October. He is married, his wife is alive, but blind from small-pox. He has a family of three children, the eldest a boy aged seventeen years. He has had ten or twelve children (not quite certain of the number) born to him, but all dead except the above. The eldest, he says, is a *págal* (fool), because he works on his own account, and does not assist his father and mother. The old man lives near the city, and gets employment in field work, earning three rupees per mensem in the ploughing season, but less at other times. He says he is always in a state of hunger. Eats salt occasionally, and oil once a year at *Sitla ke pooja*. He has never tasted ghee. Is now in jail for stealing a handful or two of grain from the fields.

“ Another man, an old passee, was admitted into jail on the same day as above. His wife, he says, is still alive, and both are supported by an only son, whose wage as a field labourer is on the average Re. 1-8 to Rs. 2 a month during ten months of the year. For two months preceding the rains he has no steady employment. When the grain crops are gathered, the son receives about one maund (80lbs) of grain from the zemindar. The mother and father are now getting too old for work : they sometimes earn one or two pice by weeding. The mother and son, finding that the earnings of the latter were too small for the support of all three, came to the conclusion that the old man must leave the house and try to gain his own livelihood by begging. He left the house, but soon found himself in jail for stealing grain from the fields.

“ The above are by no means exceptional cases. Similar ones can be found in abundance at any time.

“(r) *II.—Deaf and Dumb.*—There are in the whole Province 7,942 deaf mutes, of whom 5,506 are males and 2,436 females, being in the proportion of one in every 3,873 of general population, or among the males one in every 2,961 and the females one in every 5,895. In Lower Bengal there is one in every 2,439 of population, the females being one-third less than males. In England there is one in every 1,640, or in the sexes, one male in every 1,429 and one female in every 1,907.

“(s) In France (1861) there was one in every 1,702, or in males one in 1,498 and in females one in 1,971.

“ In Austria (1870) there was one in 1,026.

“(t) Deaf-mutism when congenital is closely allied to the insane neurosis, and is due to the same causes ; when acquired, it is as a consequence of complete loss of hearing before the child has learned to speak. It is computed that sixty per cent. of the cases in Europe are congenitally deaf, and that forty per cent. have become deaf from accidental causes. Keeping in view the small number of insanes and idiots in the Province showing a small tendency to brain defects, it is difficult to believe that many of the deaf

mutes are so congenitally ; in any case, the number should be very much less than the insanes and idiots. In England there is one deaf and dumb to every 3·1 insanes and idiots ; in France, one to every 3·8 insanes and idiots ; while in the North-Western Provinces the case is reversed, there being one to 0·6 insanes and idiots.

“(u) The same result has been obtained in Lower Bengal, where, according to the late Census, there is one deaf and dumb to every 0·7 insanes and idiots.

“(v) This difference must either be due to errors in enumeration, or to the great number of acquired deaf-mutes from the prevalence of zymotic diseases. It cannot be entirely due to the former, as you have received separate returns of the number of those who are simply deaf: so it may be that scarlet fever, measles, &c., causes of deaf-mutism at home, are as prevalent among the children born in these Provinces as they are in England. We know so little of the diseases to which the children of this country are liable that I refrain from any further remarks on this part of the subject. The most frequent causes of acquired deafness are, as stated by the Registrar-General of England, ‘scarlatina, typhus, small-pox, measles, and epileptic convulsions supervening on dentition, as well as the various forms of cerebral affection. In districts notorious for the prevalence of zymotic diseases the fruitful source of deaf-dumbness continually exist; and whether in crowded towns or the open country, wherever the supreme importance of sanitary science and preventive medicine remains unrecognised, the same lamentable results will be produced.’ The sanitary condition of towns and villages in the Province, and the number of deaf-mutes corroborate the above remarks.

“(w) *III.—Blind.*—There are 66,751 in the Province, of whom 37,360 are males and 29,391 females, being in the proportion of one in 461 of the population. The ratio in the other provinces of Bengal is as follows :—

Lower Bengal (1871) one in	... 1,279	Punjab (1869) one in	... 174
Oudh (1869) one in	... 287	Berar (1867) one in	... 263

“In European countries the proportion is much less, as shown in the following statement :—

England (1861) one in	... 994	Austria (1870) one in	... 1,785
Norway (1861) one in	... 540	Prussia (1861) one in	... 1,738
France (1861) one in 938.			

“(x) Norway has the highest ratio of blind to general population of any country in Europe, but it is rather less than in the North-Western Provinces. The great number of blind in the latter is undoubtedly due to small-pox, and the unprotected state of the people from their reluctance to accept of vaccination. Dr. W. Walker, Inspector-General of Prisons, North-Western Provinces, states in his report for last year that, of a total of 268,455 prisoners, 85·29 per cent. bore marks of small-pox, 1·56 per cent. had been inoculated, 0·95 per cent. vaccinated, 4·55 per cent. unprotected, and the remaining 7·12 per cent. were returned as doubtful. The adult population being therefore protected, it follows that children are alone exposed to attack, and in them the eyes are very liable to become inflamed or destroyed by secondary deposits. Dr. Ballard, in his prize essay on vaccination, mentions that before the time of Jenner 35 per cent. of the cases of blindness met with in England were owing to small-pox. Some time after the general adoption of vaccination the percentage fell to eight. This means when applied to the North-Western Provinces that, of the 66,751 blind, 23,364 have become so from the effects of a disease which can be eradicated by vaccinating every child, or, if the measure was only partial as in England, 18,322 individuals now blind would have had perfect vision.

“(y) There are great differences in the number of blind in the various districts. This is notably the case in Jounpore and throughout the Benares Division. In the former there are 5·4 and in the latter 9·4 in every 10,000 of the population, while in the other

divisions the number ranges from 18·7 to 29·8. This may probably be owing to inoculation, which is extensively practised in the Benares Division and in Jounpore, and nowhere else that I am aware of in the North-Western Provinces. Dr. Milne, in the Vaccination Report for 1869-70, shows that 18 per cent. of the prisoners confined in the jails of these districts bore marks of inoculation. Even after deducting 35 per cent. as due to small-pox, there still remains one blind person in every 707 of the population,—a ratio much greater than is found in all European countries, except Norway. Sufficient reasons to account for this excess are to be found in the general poverty of the lower classes, the inferior quality of their food (especially in fatty and saline principles), over-crowding in unventilated houses, the general prevalence of malarial fevers and enlargements of the spleen, and the presence of the leprosy taint,—all of these conditions are highly favourable to the development of cataract and inflammatory affections of the eye. Intense sun-light, leading to over-stimulation of the retina, and the irritating smoke from cow-dung, the common fuel of the country, may be mentioned as exciting causes of eye disease of general application in these Provinces.

“(z) IV.—*Lepers*.—The number of lepers stated, viz., 10,099, gives a ratio of only one to 3,046 of population,—a proportion very much smaller than in the other Provinces.

“In Lower Bengal the ratio is one to 1,684.

“In Oudh the ratio is one to 1,430.

“In the Punjab the ratio is one to 1,602.

“(aa) The number of lepers in other countries where the disease exists cannot be ascertained.

“(bb) According to a statement made by Professor Daa, at a meeting of the International Statistical Congress, held in London in 1860, there were 2,087 lepers in Norway in 1858. The nearest Census to that year, viz., of 1855, gives the population as 1,490,497, showing a ratio of one leper in every 714 of the population, or four times greater than in the North-Western Provinces. The cause of leprosy has not as yet been ascertained. Observers in all parts of the world where the disease is to be found agree in stating, as recorded in the report of leprosy drawn up by a Committee of the Royal College of Physicians, London, ‘That the dwellings of the leprous poor are for the most part in every country as miserable and unwholesome as they well can be. * * * The food of the classes chiefly affected with leprosy is almost invariably described as being poor, unnutritious, generally unwholesome, and often quite insufficient in quantity;’ and ‘that the want or deficiency of fresh meat and vegetables in the diet is very generally noticed.’ These remarks apply with peculiar force to the poorer classes in the North-Western Provinces, but it would require careful local investigation to explain the great differences in the number of lepers in the various districts.

“(cc) I have not attempted to account for the great variations observed in the ratio of infirmities in the different districts. Any such attempt, without a thorough knowledge of the habits, mode of life, and food supplies of the people in the districts concerned, would be presumption, and must inevitably have led to erroneous conclusions and ridiculous mistakes.

“(dd) One result of this section of the Census will, I trust, be to draw public attention to the condition of the lepers in the Province, and to the adoption of measures for their relief.

“JAMES CLEGHORN, M.D.,

“Assistant Civil Surgeon, Allahabad.”

116. I endeavoured to obtain information in regard to those peculiarities of the several districts which come out most prominently in Statement I.C. by addressing myself to the several Civil Surgeons. But, except in the case of Lullutpore, they were not in a position to give me any assistance. It appears, however, to be generally accepted that the principal cause of blindness in this Province is to be found in small-pox. The Civil Surgeon of Lullutpore was good enough to make personal inquiries throughout

the district in regard to the accuracy of the statistics of infirmities collected in Lullutpore. His letter, containing the results of his enquiries, is here appended :—

“ No. 65 C., dated Lullutpore, the 8th October, 1873.

“ From—F. W. SAUNDERS, ESQ., *Civil Surgeon, Lullutpore,*

“ To—C. W. PLOWDEN, ESQ., *In Charge of Census.*

“ SIR,—I have the honour to acknowledge the receipt of your circular letter No. 3,284, dated 12th August, 1873, calling for information about the causes which would account for the variations in the enumeration of Census statistics of infirmities collected at the late Census of 1872. Appended are two returns, prepared after examination of all the records in the Deputy Commissioner's office, giving details by village as well as by pergunnah. The numbers are found to tally with the printed return sent by you.

2. “ With reference to insane persons shown in the Census papers, I have
Insane, 18.
only had an opportunity of seeing two men, which the police sent in. These were suffering from slight cerebral derangement, caused in one by an attack of brain fever causing a little weakness of the mental powers, which readily yielded to treatment, and the other case was a victim to cruel treatment from his parents. The lad was naturally of a nervous temperament, and ill-usage excited him to acts which, though of a trivial nature, the parents exaggerated with a view of getting rid of him altogether. I kept him under observation for more than three months, and he showed no symptoms of lunacy. On my making this a subject of report to the Deputy Commissioner proper provision was made. No other cases have come under my observation nor have any been sent from this district to the lunatic asylum since my taking charge in 1870.

3. “ I have seen 5 cases out of the number noted—Lullutpore 2, Banpore
Idiots, 25.
1, and Doodhai 2 : these were all congenital, and no particular cause can be attributed. Other children from the same parents were healthy, and in full possession of all their mental faculties.

4. “ From this number I have examined 12 cases, *i. e.*, Lullutpore 5, Banpore 4,
Deaf and dumb, 35.
Barr 1, and Mehrownie 2 : all were so from birth.

5. “ Out of this number, 73 cases came under my observation, *viz.*, Lullutpore 22,
Blind, 186.
Bansee 4, Talbehut 14, Banpore 27, Mehrownie 4, and Door-junporea 2 : most of these cases were attributed to small-pox, which was epidemic in 1865-66, and from this period alone vaccination I believe was started in this district. Some of the cases, however, were of recent date, 1869-70, where disorganization of the eye followed after acute ophthalmia. This I attributed to the low ebb to which the system was brought down during the famine. A peculiar disease termed locally ‘Chikawur,’ which is a nasty phagedænic ulcer attacking the lower extremities, made its appearance about the same period.

6. “ Nine cases of leprosy have come under my observation,—six are anæsthetic,
Lepers, 30.
and the other three tubercular, with loss of all the fingers and toes and a portion of the nose. I am unable to attribute any particular cause for this disease, which seems general. However, I may remark that the three worst cases examined by me are wandering beggars who travel up and down, visiting Lullutpore and the surrounding villages. From the family history being enquired into, I learn that it is hereditary.

7. “ In conclusion, I regret that so much delay has been caused in submitting this report; it was in a great measure unavoidable, as I was determined to compare carefully every village paper with a view of testing the figures. These on comparison I have found correct. The cases, however, reported upon were every one seen by me. I was in no way guided by hearsay information, as it would be of no practical use to you.”

“ F. W. SAUNDERS,

“ *Civil Surgeon, Lullutpore.*”

"LULLUTPORE :

"The 8th October, 1873.

"F. W. SAUNDERS,

"Civil Surgeon."

117. It is satisfactory to find in the one case where these infirmity statistics have been actually verified by personal examination that they have proved so correct. We must not, however, conclude from this one instance that in all other districts equally accurate figures have been secured.

IX.—Education of the People.

121. This is a subject which I shall pass by with but few remarks. The Statements III. A., and III. B. are admittedly imperfect, and cannot be received as correctly illustrating the spread of education in the Province. As an instance of the omissions which have unquestionably occurred in the enumerators' returns and the abstracts prepared from them, I may notice the case of a pergunnah containing the head-quarters of a district—a city with a population of nearly 50,000 inhabitants. The number of Mahomedans entered in the abstracts as able to read and write did not exceed fifty, though there were that number, and far more, of Government servants living in the city alone, who were constantly employed on work which necessitated a fair education.

122. The form of return prescribed for the enumerators containing no column for the entry of those females who were able to read and write, the Census statements have actually excluded women and girls from the statements relating to education. It is thus that the very small number of women able to read and write, as recorded in the Census, is explained.

123. In Table III. a note has been added against each district showing the number of persons under tuition, taken from the report of the Director-General of Public Instruction, and an imperfect standard of comparison is thus afforded for testing the correctness of the section in the first two columns of No. III. B. and III. A. Statement in regard to the number of persons up to 20 years of age able to read and write.

The districts that come out best are (excluding Kumaon) Benares, where 209 out of every 1,000 are able to read and write, and the following :—

Jaloun,	... 162	Allygurb,	... 111
Jhansie,	... 145	Humeerpore,	... 109
Cawnpore,	... 139	Boolundshuhur,	... 107
Muzuffurnugger,	... 131	Shahjehanpore,	... 102
Agra	... 130	Furruckabad,	... 100
Mirzapore,	... 128		

In all other districts in the plains the recorded figures give a less proportion than one out of every ten of the male population as able to read and write.

X.—Revenue, Area, and Population.

124. Statement IV., which is the next in the series following those I have already dealt with, contains some interesting information. It should be read in concert with Table I., if information for the tehseels and subdivisions of the districts is required.

125. It portrays the Province as containing an area of 81,403 square miles, of which a little more than half is cultivated, and an additional sixth is culturable; about one-third of the whole being unculturable.

Excluding the hill division of Kumaon, we have the following figures :—

Out of a total area of 69,903 square miles
the cultivated portion is 41,647 ditto.
the culturable do. is 11,913 ditto.
and the unculturable is 15,943 ditto.

Of this, 63,860 square miles are charged with Government revenue, comprising 38,603

tion of the inhabitants of Hindustan. They are more wretchedly poor than we have any notion of. Europeans have hitherto been too apt to draw their opinions of the wealth of Hindustan from the gorgeous pomp of a few Emperors, Sultans, Nawabs, and Rajahs; whereas a more intimate and accurate view of the real state of society would have shown that these Princes and Nobles were engrossing all the wealth of the country, whilst the great body of the people were earning but a bare subsistence, groaning under intolerable burdens, and hardly able to supply themselves with the necessaries of life, much less with its luxuries."—*Buckle's History of Civilization*, vol. I., page 70.

Turner, who travelled in 1783 through the north-east of Bengal, says:—"Indeed, the extreme poverty and wretchedness of these people will forcibly appear when we recollect how little is necessary for the subsistence of a peasant in these regions. The value of this can seldom amount to more than one penny per day, even allowing him to make his meal off two pounds of boiled rice, with a due proportion of salt oil, vegetables, fish, and chilli."—*Turner's Embassy to Tibet*, page 11.

square miles cultivated, and 11,434 square miles capable of cultivation. The remaining 13,822 are unculturable. The revenue payable to Government, including local rates and cesses, is for this part of the Province £4,477,919, and the rent paid to the landlords is put down at £7,855,124. If Kumaon is included, the Government revenue and local rates rise to £4,515,273, and the rents to nearly £8,000,000.

Nearly one-twelfth of the whole area is charged with no Government revenue; two-fifths of this appear, however, to be unculturable. The males above 15 years of age who are employed in the cultivation of this large area number 5,963,246. Nearly three persons are dependent on each of them, and for their support the average holding of each agriculturist would appear to be $4\frac{1}{3}$ acres.

It cannot be said that the rents shown in column 20 represent accurately what would ordinarily be understood by the term rent in a country where the land was generally cultivated by tenants and not by proprietors. In the North-West Provinces, however, the cultivating proprietor is found in almost every village, and it often happens that a large part of an estate is worked entirely by the owners of the land.

126. I wish it were in my power to give any estimate which could be accepted as near the mark, not only of the rent, but of the gross produce of the land, and that I could add figures showing the acreage under different kinds of crops. This, however, must be reserved for some later enumeration, when such information shall have been collected.

There are a few points in connection with this statement in which comparisons with European returns can be made.

127. It will be seen from the accompanying Abstract N. that the cultivated area in these Provinces,—whether we include cultivable under cultivated or keep the two figures separate,—bears a proportion to the total area which is high compared with European figures. It must be remembered that the cultivated area in this Province is almost entirely under crops, which, in the English returns from which I have extracted Tables N.I. and N.II., would bring the area so cropped under the heading “under corn crops.” A comparison of the third column of N.I. will at once show how high a rank the N.-W. Provinces would take in such a statement, if we had figures describing exactly the amount of land under crops similar in their nature to those that find a place in Table N.II.

If Kumaon and the mountainous tracts in Dehra and Saharunpore were excluded from the comparison, the position of the North-Western Provinces in regard to cultivated area would stand out even in greater relief. For the total Province, excluding only the Kumaon Division, the percentage of cultivated area on total area is 59·6, and of cultivable and cultivated areas combined the percentage on total area is 79·5.

128. The agricultural returns for the United Kingdom for 1872 furnished to the Board of Trade, from which I have taken Tables N.I. and N.II., show that in Great Britain only six per cent. of the population are employed in agriculture, and a little more than five persons were employed upon every 100 acres of land. In Ireland, 18 per cent. of the population belong to the agricultural class, and there are about nine persons employed to every 100 acres.

In France it is stated, in a paper recently read by the Secretary to the Royal Agricultural Society, that there are 7,330,000 persons connected with agriculture. But I conclude this comprises children and others forming a part of the families of the agriculturists, and cannot therefore be compared with Mr. Valpy's figures, which relate purely to persons actually employed in the cultivation of the soil.

129. The rental of England (without Wales) is put down at £102,334,254. I do not think the figures in column 20 of Statement IV. are sufficiently trustworthy to permit of any contrast being drawn between them and the figures given above for England.

A very rough estimate, based on the probable yield of the land under cultivation, induces me to think the real rents of the Province might without impropriety be taken at nearly double the sum given in column 20.

XI.—Castes of the People.

130. The most laborious part of the work of compiling the Census Returns has been the preparation of the caste statements and the sex statistics connected with them. The latter, which occupy Vol. III., are an excrescence to the Census proper, and were extracted with a view to throwing some light on the possible existence of female infanticide in particular tribes. In the preparation of Statement V. and its supplement an immense amount of labour has been expended. It unfortunately happened, in my absence on leave in May to August, that through a misconception of the head clerk in charge of this department the form drawn up for the preparation of this voluminous statement,—a form in which I had seen the figures for one district entered as an exemplar for the rest,—was set aside. The mode in which the district tables were subsequently prepared was such that it was impossible to extract from them, without entirely revising them, the information which alone would permit of the Provincial Statement being drawn up. It became necessary to recompile the whole of these returns, and as a necessary consequence of the imposition of so much extra labour on an office which had been reduced as soon as the former caste statements were prepared, there was great delay in getting out the statement. Had it not been for this unfortunate error, my report would have been finished by the 1st October last.

131. The whole question of caste is so confused, and the difficulty of securing correct returns on this subject is so great, that I hope on another occasion no attempt will be made to obtain information as to the castes and tribes of the population. The work is somewhat foreign to an enumeration, and it can be done with far greater prospect of success if the putwarees' jumabundees are used for the rural population, and the meer mohullahs, or perhaps the choudhrees of particular castes, are resorted to for the residents in towns.

132. Statement V. draws no distinction between the different castes of Brahmans, Rajpoots, and Bengalees. To have attempted such a distinction in the form which that statement takes would have made it three times as voluminous as it is, and it already contains one hundred and ten pages. A supplement was therefore prepared, which gives the requisite details for the three primary castes. I think it may be said that the main errors in the distinction of the several castes are confined to this supplement. We may accept as fairly correct the figures recorded in Statement V., which show that, out of the 26,565,602 Hindoos for whom details of caste have been recorded, the Brahmans muster 3,234,342, the Rajpoots 2,395,688, and the Buniyas 1,025,342. These three great castes, then, form a fourth of the whole Hindoo population. Mr. Growse, whose archæological knowledge renders him especially competent to treat the question successfully, has kindly aided me by permitting me to make use of the following remarks on the origin of caste; and it will be seen from them how far, in his opinion, the Buniyas and other castes shown in Statement V. have separated themselves by degrees from the two great parent stocks, Bráhmaṇ and Thákúr. I must add that Mr. Growse's remarks were written after the returns had been compiled in their present shape. Had he been present on the spot, I should have taken advantage of his aid to improve the return :—

“CASTE : ITS ORIGIN AND DEVELOPMENT.

“Indian caste is ordinarily regarded as an institution *auí generis*, which must be accepted as a potent social influence, but cannot be explained either by parallel facts in other countries or by an enquiry into its own development, since that is buried in the depths of pre-historic antiquity. Such an opinion is now to be combated. Whatever may be thought as to the similarity between the restrictions imposed by caste in India and by other artificial contrivances in Europe, it is certain that, though the

broadly-marked separation of the Brāhman from the Thākūr dates from an extremely remote period, the formation of subordinate castes is a process which continues in full operation to the present day and admits of direct observation in all its stages. The course of Indian tradition is, to all appearance, unbroken, and until some breach of continuity is clearly proved, the modern practice must be acknowledged as the legitimate development of the primary idea.

“It is nothing strange that the Hindoos themselves should fail to give any reasonable explanation of the matter, since not only are they restricted by religious dogma, but every society is naturally as blind to the phenomena of its own existence as the individual man is unconscious of his daily physical growth. On the other hand, European outsiders, who might be expected to record simple facts with the accuracy of impartial observers, are misled by the prejudices which they have inherited from the early investigators of oriental literature.

“The Code of Manu was among the first, if not the very first, Sanskrit didactic work of any importance made known to the world at large through the medium of a translation. At that time it was unhesitatingly accepted as the ultimate authority on all the subjects on which it treated, and hence the four-fold division of Hindoo society into Brāhman, Kshatriya, Vaisya, and Sudra was universally recognized as an absolute fact. The later discovery of the Vedas, and the vast reach of antiquity which opened out upon their interpretation, made the Mānava Dharma Śāstra appear a comparatively modern production. Thus, the explanations which it gives of phenomena dating back in their origin to the remotest past can only be regarded as theories, not as positive verities, while, again, the vast range of later Sanskrit literature which has now become available to the student affords a test of its accuracy in the descriptions which it gives of contemporary society. Impartially judged by either standard, the authority of the Code will be found materially shaken. Its theories of origin are as devoid of Vedic confirmation as its pictures of existent society are irreconcilable with the testimony of all independent literature, whatever the age in which it was produced. If such a clearly defined four-fold division ever existed, how happens it that one-half of the division remains in full force to the present day while the other moiety has sunk into absolute oblivion? The Brāhmanical order is still a living entity, and the Kshatriya is adequately represented in modern speech by the word Thākūr or Rājput, while the Vaisya and Sūdra have so completely disappeared, both in name and fact, that an unlettered Hindoo will neither understand the words when he hears them nor recognize the classes implied when their meaning is explained to him.

“And not only is this the fact in the present day, but it appears to have been so all along. In the great epic poems, in the dramas, and the whole range of miscellaneous literature, the sacerdotal and military classes are everywhere recognized, and mention of them crops up involuntarily in every familiar narrative. But with the Vaisya and Sūdra it is far different. These words (I speak under correction) never occur as caste names, except with deliberate reference to the Mānava Code. They might be expunged both from the Rāmāyana and the Mahābhārat without impairing the integrity of either composition. Only a few moral discourses, which are unquestionably late Brāhmanical interpolations, and one entire episodical narrative, would have to be sacrificed: the poem in all essentials would be left intact. But should we proceed in the same way to strike out the Brāhman and the Kshatriya, the whole framework of the poem would immediately collapse. There is abundant mention of Dhīvars and Nāpitas, Sūtradhāras and Kumbhakāras, Mahājānas and Baniyas, but no comprehension of them all under two heads in the same familiar way that all chieftains are Kshatriyas, and all priests and litterateurs Brāhmans.

“It is also noteworthy that Manu, in his 12th book, where he classifies gods and men according to their quality (*guna*), omits the Vaisya altogether; and, again, in the Adi Parvan of the Mahābhārat (v. 3139) we read---

Brahma-Kshatrādayas tasmād Manor jātis tu manavaḥ,
Tato 'bhavād, Mahārāja, Brahma Kshatrena saṅgataḥ.

From which it is clear that the writer recognized a definite connection between the Bráhmaṇ and the Kshatriya, while all the rest of mankind were relegated to the indeterminate. And, further, if the Vaisyas had ever formed one united body, they would inevitably, at some period or another, have taken a more prominent part in Indian politics than there is reason to suppose they ever did. Investiture with the symbolic cord gave them social position, and the wealth which their occupation enabled them to amass gave them power. Union apparently was the only condition required to make them the predominant body in the State. With far humbler pretensions and less internal cohesion than Manu assigns to the Vaisyas, the free cities of Germany and the burghers of England established their independence against an aristocracy and an ecclesiastical system in comparison with which Kshatriyas and Bráhmaṇs were contemptible.

"The obvious, and indeed inevitable, inference from this popular ignorance, literary silence, and historical insignificance appears to be that the two classes of Vaisya and Súdra never existed (except in Manu's theory) as distinct bodies; and that the names are merely convenient abstractions to denote the middle and lower orders of society, which have indeed distinctive class features engendered by similarity of occupation, but no community of origin, and in reality no closer blood connection between the component sub-divisions than exists between any one of those sub-divisions and a Bráhmaṇical or Kshatriya family.

"In the whole of the Rig Veda the word Vaisya occurs only once, viz., in the 12th verse of the famous Puruṣa Sūkta. Dr. Muir, Professor Max Müller, and in fact all Sanskrit scholars, with the solitary exception of Dr. Haug, assign this hymn to a comparatively late period. It is the only one which mentions the four different kinds of Vedic composition, *rich*, *sáman*, *chhanda*, and *yajush*, a peculiarity noticed by Professor Aufrecht, and which seems to be absolutely conclusive proof of late composition. And not only is the hymn itself more recent than the body of the work, but the two verses which alone refer to the four castes seem to be a still more modern interpolation. In the first place, there is nothing the least archaic in their style, and they might stand in any one of the Puráṇas without exciting a comment. That this may be apparent they are quoted in the original :—

Bráhmaṇo 'sya mukham ásid, báhu Rájanyah kritah,
Uru tad asya yad Vaisyah, padbhyám Súdros ajayata.

"Secondly, they are irreconcilable with the context, for, while they describe the Bráhmaṇ as the mouth of Puruṣa and the Súdra as born from his feet, the very next lines speak of Indra and Agni as proceeding from his mouth and the earth from his feet.

"We are, therefore, justified in saying that in the genuine Veda there was no mention of caste whatever; nor was it possible that there should be, on the hypothesis now to be advanced, that the institution of caste was the simple result of residence in a conquered country. This is confirmed by observing that in Kashmír, which was one of the original homes of the Aryan race, and also for many ages secured by its position from foreign aggression, there is to the present day no distinction of caste, but all Hindoos are Bráhmaṇs. Thus, too, the following remarkable lines from the Mahábhárat, which distinctly declare that in the beginning there was no caste division, but all men, as created by God, were Bráhmaṇs :—

Na visesho 'sti varnánám, sarvam Bráhmaṇ idam jagat
Brahmaná púrva-srishtam hikarmabhir varnatám gatam.

At the time when the older Vedic hymns were written, the Aryan was still in his primeval home, and had not yet descended upon the plains of Hindustan. After the invasion, the conquerors naturally resigned all menial occupations to the aborigines, whom they had vanquished and partially dispossessed, and enjoyed the fruits of victory while prosecuting the congenial pursuits of arms or letters. For several years, or pos-

sibly generations, the invaders formed only a small garrison in a hostile country, and constant warfare necessitated the formation of a permanent military body, the ancestors of the modern Kshatriyas and Thākurs. The other part devoted themselves to the maintenance of the religious rites which they brought with them from their trans-Himalayan home, and the preservation of the sacred hymns and formulae used in the celebration of public worship. Of this mystic and unwritten lore, once familiar to all, but now, through the exigency of circumstances, retained in the memory of only a few, these special families would soon become the sole depositaries. The interval between the two classes would gradually widen, till the full-blown Brāhman was developed, conscious of his superior and exclusive knowledge, and bent upon asserting its prerogatives. The conquered aborigines were known by the name of Nāgs or Mlechhas, or other contemptuous term, and formed the nucleus of all the low castes, whom Manu subsequently grouped together as Sūdras, esteeming them little, if at all, higher than the brute creation. (*Hastinas cha turangās cha Sūdrā Mlechhlās cha garhitāh—Sinhā vydghrā varāhās cha.* XII. 43.)

“But a society consisting only of priests, warriors, and slaves could not long exist. Hence the gradual formation of a middle class, consisting of the offspring of mixed marriages—enterprising natives and unambitious members of the dominant race who found trade more profitable or congenial to their tastes than either arms or letters. The character of this mixed population would be influenced in the first instance by the nature of the country in which they were resident. In one district the soil would be better adapted for pasturage, in another for agriculture. But in both it would be worked principally by aborigines, both on account of the greater labour involved, and also because the occupation of grazing large flocks and herds is incompatible with the concentration which is essential for the security of a small invading force. These people would receive a name descriptive of their nomadic habits, and thus originated the caste of Ahirs, the word being derived from *abhi*, ‘circum,’ and *ir*, ‘ire,’ the *circumcutes*, or wanderers. Similarly, the other pastoral tribes of the Gwālās, the Ghosis, and the Gadariyas, derive their distinctive names from *go*, ‘a cow,’ *ghosha*, ‘a cattle station,’ and *gadar*, ‘a sheep.’ In an agricultural district the corresponding class would also adopt some title indicative of their occupation, as, for example, the Kisāns from *krishi*, ‘husbandry,’ the Bhūnhārs from *bhūm*, ‘the ground,’ and in Bengal the Chāsis from *chās*, ‘ploughing.’ Or (and the same remark applies to every other class) they might retain the old Indian name of the district in which they were located, as the Kāchhis from the country of Kachhi. Again, so long as vast tracts of lands were still covered with forest, the followers of the chase would be at least as numerous as the tillers of the soil or the grazers of cattle. And, since the Aryan element in the middle and lower strata of society was composed of those persons who, without any *penchant* for learned study like the Brāhmins, entertained a preference for sedentary pursuits rather than those of a more exciting nature such as the majority of their Thākūr kinsmen affected, so the castes that followed the chase, not as an amusement, but as a means of livelihood, would naturally consist exclusively of aborigines. And, as a matter of fact, this is found to be the case,—that all such castes have the dark complexion and the other physical characteristics of the lower race. Such are the Badhaks and Aheriyas, who derive their name—the one from the root *badh*, ‘to kill,’ the other from the Hindi *aher*, ‘game’; so, too, the Dhānuks and the Lodhas, whose names are contracted forms of Dhānushka, ‘a Bowman,’ and Lubdhaka, ‘a huntsman.’ These two tribes have now abandoned their hereditary avocations,—the Dhānuks being ordinarily village watchmen, and the Lodhas agriculturists, though in Oudh the latter were, till quite recently, still connected with the forest rather than the fields, being the wood-cutters, whose business it was to fell timber and transport it by the Ghoghra river to Bahram Ghāt and other marts.

“In this way the majority of the servile, or so-called Sūdra, castes came into existence, in order to supply the unproductive classes with food; and subsequently, when population grew and towns were built, their number was vastly increased by the

new trades that sprang up to satisfy the more complex requirements of urban life. Then, too, last of all, and by no means simultaneously with the other three, as represented in the legends, the Vaisya order was produced. For the purpose of facilitating barter and exchange, traders established themselves either on the sea-coast or at places convenient of access for the inhabitants of two dissimilar tracts of country, and forming a confederation among themselves would take a collective name, either from the locality which they occupied, as Ajudhyávasis, Mathuriyas, or Agarwálas, or simply from the special branch of trade which they pursued, as Sonárs, Lohiyas, or Baniyas. From the facility of acquiring wealth and the civilizing influence of social contact these merchants would soon form a striking contrast to the simple rural population who brought their produce for barter, and would receive some vulgar title indicative of the difference; hence the name of Mahájans, "the great people." And all such names, having once firmly attached themselves, would be retained, even when they ceased to be strictly applicable, in consequence of migration from the original seat or change in profession or circumstances. Upon this theory we come to a clear understanding of the popular feeling about caste—which unmistakably exists in the native mind, though opposed to dogmatic teaching—that below the Bráhmaṇ and the Thákúr there are a number of miscellaneous divisions, but no two well-defined collective groups. There is a vague impression that the Vaisya is properly a tradesman, and the Súdra a servant; while it is definitely ruled that the former is the much more respectable appellation of the two. Thus, a difficulty arises with regard to a family that is distinctly neither of Bráhmaṇ nor Thákúr descent, and from time immemorial has been engaged in some specially ignoble trade or exceptionally honourable service. The latter aspires to be included in the higher order, in spite of his servitude; while the former, though a trader, is popularly ranked in the same grade as people who, if they are to be known by any class name at all, are clearly Súdras. This never occurs in precisely the same way with the two higher Mánava castes, though one or two facts may be quoted which at first sight seem to tell against such an assertion. For example, there are a numerous body of carpenters called Ojhas (the word being a corruption of Upádhya), who are admitted to be of Bráhmaṇical descent and are invested with the sacred cord. But common interests forming a stronger bond of union than common origin, they are regarded rather as a species of the genus Barhai than of the genus Bráhmaṇ, their claim, however, to the latter title never being disputed if they choose to assert it. Similarly, as the trade of the usurer is highly incompatible with priestly pretensions, the Bráhmaṇs who practise it are gradually being recognized as quite a distinct caste under the name of "Bohras." There are also some *pseudo*-Bráhmaṇical and *pseudo*-Thákúr tribes who rank very low in the social scale; but even their case is by no means a parallel one, for it is admitted on all sides that the original ancestor of the Bháts and Ahirvásis was a Bráhmaṇ, and of the Gauruas a Thákúr. The doubt is, whether the descendants, in consequence of the bar sinister on their blazon, have altogether lost their ancestral title or only tarnished its dignity, whereas with a Sonár or a Dhúsar, who claims to be a Vaisya, it is not any suspicion of illegitimate descent, nor any incompatibility of employment, that raises a doubt; but rather the radical incompleteness of the original theory and the absence of any standard by which his pretensions may be tested.

"In short, excepting only the Bráhmaṇ and the Thákúr, all other Indian castes correspond, not to the Scottish clans, with which they are so often compared, and from which they are utterly dissimilar, but to the close guilds which in medieval times had so great an influence on European society. As the Gildeniths formed themselves into a company for mutual protection, so the Sonárs combined to make a caste;—the former admitted many provincial guilds with special customs and regulations, the latter recognized many subordinate *gilds*; the former required a long term of apprenticeship amounting virtually to adoption, the latter made the profession hereditary; the former required an oath of secrecy, the latter insured secrecy by restricting social intercourse with outsiders. As the founders of the company had no mutual connection beyond

community of interest, so neither had the founders of the caste. When we say that all architects are sons of S. Barbara, or all shoemakers of S. Crispin, these being their patron saints, the expression is quite intelligible. What more is implied in saying that all Sanádhs are sons of Sanat-Kumára? To attach any literal meaning to a tradition which represents a Bráhmancial caste as born of the Gáyatri is a precisely similar absurdity to saying a company was born of the Pater-Noster and Ave Maria, because on certain days every member was bound to repeat his rosary. A history of caste, in the sense in which the phrase is generally understood, *viz.*, the tracing each caste to one definite pair of ancestors, is, from the circumstances of the case, an impossibility.

“With Bráhmans and Kshatriyas matters stand somewhat differently. Though so far as any one subordinate division is concerned, it may often happen that its individual members never at any time formed one family, yet as all the sub-divisions are in the main descendants of the early Aryan conquerors, to that limited extent they have a genuine community of origin. So long as the line of demarcation which separated them from the aboriginal inhabitants of India remained clearly defined, while the only distinction among themselves lay in the difference of occupation, the conversion of a Kshatriya into a Bráhman would not be a more unusual occurrence than the retirement of a Christian knight, when wearied with warfare, into the peaceful seclusion of the cloister. The most famous example of such a transformation is that supplied by the legend of Visvámitra, which must ever prove an insuperable difficulty to the orthodox Hindoo who accepts the Mánava doctrine of an essential and eternal difference between the two castes. At the present day, when Bráhmanism has become an inseparable hereditary quality, the priestly character has been transferred to the religious mendicants and ascetics who, allowing for the changed circumstances of time and place, correspond to the Bráhmans of antiquity, and like them freely admit associates from every rank and condition of Hindoo society. The apparent difference is mainly due to the fact that in primitive times the Aryan outsiders were all of one status, while now they are infinite in variety.

“Theoretically, the essence of the Kshatriya is as incapable of transfer or acquisition except by natural descent as that of the Bráhman, but the practice of the two classes has always been very different. The strength of a community that lays claim to any esoteric knowledge lies in its exclusiveness; but a military body thrives by extension, and to secure its own efficiency must be lax in restrictions. It may be observed as a singular fact that all the very lowest castes in the country, if interrogated as to their origin, will say that they are in some way or another Thákúr: and this is illustrated by a passage in Manu, where he mentions several outcast tribes as Kshatriyas by descent. Whence we may infer that at all times there has been a great freedom of intercourse between that class and others. Indeed, if we are to accept the legend of Parasurám as in any sense expressing an historical event, the whole Thákúr race has been repeatedly extirpated and as often re-formed out of alien elements. Nor is this at variance with modern usage, for no Hindoo rises to the rank of Rájá, whatever his original descent, without acquiring a kind of Thákúr character, which in most instances is unhesitatingly claimed by and conceded to his descendants in the third or fourth generation, after alliances with older families have given some colour to the pretension. And the illegitimate sons of Thákúrs, who by the Code of Manu would be Ugras, their mothers being Musalmánís or low-caste Hindoo women, are, as is notorious, generally accepted, either themselves or in the person of their immediate descendants, as genuine Thákúrs. Again, many of the higher Thákúr class acknowledge the impurity of their birth in the popular tradition of their origin. Thus the Chandels (*i. e.*, the moon-born) profess to be derived from the daughter of a Banáras Bráhman, who had an intrigue with the moon-god; and the Gahlots (the cave-born) from a Ráni of Mewár, who took refuge with some mountaineers on the Malya range.

“From all this it follows that, whatever the dignity and antiquity of some particular Thákúr families, the Thákúr caste is a heterogeneous body, which, like the miscellaneous

communities of lower pretensions which we have already discussed, is held together more by similarity of circumstances than unity of origin. The same principle of caste-formation is still actively at work through all grades of Indian society. The comparatively modern organization of many so-called castes is attested by the Persian names which they have thought proper to assume,—for example, the Darzis, the Malláhs, the Mímárs, &c. A large proportion of the first-named are really Káyáths, which shows that the term ‘Darzi’ is still in a transitional state, and has not yet thoroughly shaken off its original trade meaning. The older word for a tailor is *súji*, which, like so much of the Hindi vocabulary, having become unfashionable, now implies a workman of an inferior description. Similarly, *randi*, ‘a woman,’ has become a term of reproach for ‘a woman of bad character;’ and *nagara*, Hindi for ‘a city,’ is at the present day used to denote, not even a village, but only a mere ‘hamlet.’ The desire to dignify a mean calling by a high-sounding name, as when a sweeper is called *mihtar*, ‘a prince,’ and a cook *khálfa*, has been often cited as an oriental idiosyncrasy, which to the mind of a European is productive of ridicule rather than respect. It gives occasion, however, to many a new caste-name inserted in the accompanying tabular statements. Thus, the *khák-rob* of the town regards himself under that Persian designation as the superior of the village *bhangí*; and the Mímár, or Shoragar, or Chúnápaz, or Kori, or even Mochi, in assuming the name descriptive of his calling, almost forgets that he belongs to the universally-despised caste of the Chamár.

“To judge from the Census Returns, it would seem that these partially-developed castes are only recognized in some few districts, and totally ignored in others. Thus, Mathurá is a great centre of the stone-cutter’s art; but the men who practise it belong to different ranks, and have not adopted the distinctive trade-name of *Sang-tarásh*, which seems to be recognized in Aligarh, Hamirpúr, and Kumaon. Again, in every market town there are a number of weighmen, who, no doubt, in each place have special guild regulations of their own; but only in Banáras do they appear as a distinct caste, with the name of *Palle-dárs*. So, too, at Saháranpúr some fruit-sellers, whose trade it may be presumed has been encouraged by the large public garden at that station, have separated themselves from the common herd of *Kunjrás*, or ‘costermongers,’ and decorated their small community with the Persian title of *Mewafarash*. As might be expected, this disintegration of society and adoption of a novel nomenclature prevails most extensively among the lower orders, where the associations connected with the old name that is discarded are of an unpleasant nature. But even in the higher classes, where the generic title is one of honour, it is frequently superseded in common parlance by one that is more distinctive, though it may be of less favourable import. Thus, among Bráhmans a Bohra sub-caste is in course of formation, and a Chaube of the Mathurá branch when settled elsewhere is invariably styled, neither Bráhman nor Chaube, but Mathuriya. But enough has now been said to explain the general bearings of the matter, and it would be wearisome to follow it out into further detail.

“As may have been inferred from the tenor of some of the above remarks, the writer is not altogether in accord on a few matters of detail with the compiler of the report upon which they are based. There is, however, a perfect agreement as to the main principle of the classification, by which the two imaginary castes of Vaisya and Súdra have been expunged altogether; and after the three well-defined groups of Bráhman, Thákúr, and Baniya, all the remainder have been thrown together as miscellaneous. It may be doubtful whether many of the low modern divisions, some of which have been incidentally specified, have any claim to be considered castes at all, and whether it was desirable to include in a general list some that contain so few members that they can be of no general or political importance. Their inclusion would be useful as rendering the statement complete, if it could have been uniformly carried out. But in some districts the peculiar tribes are omitted altogether—for example, the two Bráhmanical tribes, the Ahivásis and Mathuriya Chaubes, that are found in the Mathurá District. The former constitute almost the entire population of several very large villages, of

which they are also the landed proprietors, while the Chaubes muster at least 6,000 strong in the city of Mathurá, and form one of the characteristic features of the place. In the same district also there are no real Thákúrs: all the people so styled in the list bear the names of different Thákúr sub-divisions, such as Gaur, Jáes, and Báchhal, but their proper generic designation is Gauruas, and they are quite distinct from the Gaur, Jaes, or Báchhal Thákúrs that are met elsewhere. Again, in many districts the comparative strength of each sub-caste must only be accepted as roughly approximate. If regarded as final it would lead to considerable error, for the number of Bráhmans and Thákúrs entered as 'unspecified' is so large that, if it could be distributed, it would not unfrequently necessitate a complete re-arrangement of the relative numbers of the 'specified' classes. Probably when any one sub-division was exceptionally strong its members called themselves simply Bráhmans or Thákúrs as the case might be, and left the specific names to be recorded only by the minor tribes. But without more local information than is at present accessible, complete accuracy was unattainable. Before the next Census is taken a series of district memoirs will probably have been compiled, in which all such matters will have been duly noticed; and it will then be possible to remove the perplexity of enumerators by issuing beforehand definite instructions for their guidance with special reference to the peculiarities of each territorial division.

"MATHURÁ :
"21st October, 1873. }

"F. S. GROWSE."

133. Compared with 1865, both the Bráhmans, Rájputs, and Buniyas show a decrease in number, the figures being—

		<i>Brahmans.</i>	<i>Rajpúts.</i>	<i>Buniyas.</i>	<i>Other Castes.</i>
1872,	...	3,234,342	2,395,688	1,025,342	19,910,230
1865,	...	3,451,692	2,827,768	1,091,250	18,304,309

On the other hand, the other castes have increased. No other inference can be drawn from this except the relatively greater precision with which the line of demarcation has been maintained on the last occasion.

It would seem from the returns that the Bráhmans exist in greatest numbers compared with the rest of the Hindoo population in the Allahabad Division. Next to Allahabad comes the Agra Division. Rohilkhund has the smallest proportion; and the largest numbers absolutely of this caste are found in the districts of the Benares Division.

Of the Rájputs the largest proportion, compared with the rest of the Hindoo population, is found in the Agra Division; next comes the Allahabad Division; and after that, Rohilkhund.

The Buniyas are found in largest proportions in the Meerut Division; next comes Agra, and next Allahabad.

134. Examined by districts, we find the largest absolute number of Bráhmans in Goruckpore, where there are 193,270; Cawnpore contains 183,304; Allahabad 173,976; Bustee, a nearly similar number (173,056); while Mirzapore (161,372) and Agra (154,520) are the only other districts in which the Bráhmans exceed one hundred and fifty thousand.

Turning to the Rájputs, we find more than ten per cent. of their whole number to be residing in the Ghazeepore district (295,355). They exist in large numbers in Kumaon (181,633) and Gurhwal (115,684); Azimgurh stands next to Ghazeepore among the plains districts with 153,814 Rajpoots. There are only two other districts in which the Rájputs exceed in numbers 100,000. These are Agra (111,066) and Jounpore (109,995).

The Buniyas are most numerous as a caste in Meerut, where they comprise 69,942 persons. It is possible the large number of this caste in the Meerut district will partly account for the high place taken by Meerut in regard to the income-tax

collections made there. Agra has 58,064 persons of this caste; Allygurh, 53,544; Muttra, 52,822. No ruckpore contains fifty thousand, but Ghazeepore approaches that limit other district contains as many as that Cawnpore should only contain 37,451 persons very closely. It seems surprising 125.

135. There are no less than "different castes," that is, castes of and Buniyas. In some of these same caste appears in one district under another designation,—for instance, the "Chamár Gour," the case in every case but in the Turrai. There, however, division this class has been shown through the error of the abstractors, the Chamár Gour have been classed with "different castes." In some cases the particular caste is lost sight of in the occupation it pursues: for instance, the term Mochi has in many districts displaced the more proper caste designation Chamár, and it is only in Jounpore, Ghazeepore, and Bustee that there are no Chamárs who prefer to class themselves as Mochis.

Conversely, the sweetmeat-makers, whether than occupation are found in all the districts under their caste designation, in Muttra, Agra, and all those of the Jhansi District. of the Meerut division, in the Turra excepting Meerut, not a single Hulwai has been so. In every one of these districts, appear, though in reality they number hundreds. recorded, and in Meerut only 58 a ; numbers are not numerous, and below one thousand.

136. The castes predominant from this point of view. It will be seen from this that 50 out of the 304 designations comprise the main body of the persons classed under "other castes." Two great castes, the Chamárs and Ahirs, contain nearly one-third of the whole, and the Chamars by themselves compose more than one-tenth of the entire population and almost one-sixth of the Hindoos. Nearest in number to the Ahirs, who exceed two millions and a quarter, come Kurmis (945,959), Kahars (707,183), Kachhis (674,071,) and Lodhas (642,334). (726,160), Jats (724,096), Kolis (642,334), and Lodhas (642,334). After these well-known agricultural castes come—Gadarias (587,838), and next to them Hajjams (465,381), the barbers and "match-makers of Indian life," as Mr. Forbes described them in 1865.

	Province, but are most numerous in	Agra (176,933).		
	(205,658), Meerut (197,273), and			

The Ahírs are also found throughout all the districts in the plains, but prevail most extensively in the south-eastern districts from Mynpoory downwards. In the Meerut Division their numbers are comparatively few; and the very small number recorded against Muzuffernuggur leaves it open to doubt whether they have been correctly given in that district. It is certainly strange to find that in the districts, on each side of Muzuffernuggur this caste is numbered by thousands, while in Muzuffernuggur only 568 are recorded.

The next numerous tribe, the Kurmis or Kunbis, prevail most largely, like the Ahírs, in the south-eastern districts, more than two-thirds of them being found in the Allahabad and Benares Divisions. But though this is the case, the district in which their numbers are highest is Bareilly (166,280). In Muzuffernuggur, again, this caste, like the Ahírs, drops to insignificance. Only 15 Kurmis are recorded for Muzuffernuggur, and 56 for the neighbouring district of Bijnour. They are found in very small numbers in the Meerut Division.

The Kahárs prevail most largely in the northern districts,—nearly half of their whole numbers being found in the Meerut and Rohilkhund Divisions; the district of Bareilly containing the highest number (63,495).

The Játs, who stand fifth on the list, are located exclusively in the northern districts, and in the four divisions—Jhansie, Allahabad, Benares and Kumaon—only 3,341 individuals of this caste are found. Meerut contains them in largest numbers (145,514); Muttra comes next with 141,073; Allygurh has 89,292, and Agra 70,645 of the remainder. Thus, these four districts contain more than a half of this caste.

The Kolís or Korís, another well-known agricultural caste, take the place of the Játs in the southern divisions. They are found also in considerable numbers through the more northern districts. Jounpore is the only district besides the Turrai in which they do not figure. In Muzuffernuggur there are only 549 of this caste shown. They are found in largest numbers in Mirzapore (62,887) and in Azimgurh (46,279).

The Kachhis, another race of good cultivators, are found principally in the divisions of Agra (315,319) and Allahabad (150,853). Excluding the Turrai, there are five districts in the plains where they do not appear. These are Benares, Ghazeepore, Goruckpore, Bustee, and Moradabad. Furruckabad (78,337) and Mynpoory (72,898) contain them in largest numbers; and in all the districts of the Meerut Division except Allygurh, they appear only in isolated cases.

The Lodhás, another cultivating caste, are pretty equally distributed throughout the five divisions Meerut, Rohilkhund, Agra, Jhansie, and Allahabad; but it is in the Agra and Allahabad Divisions that they mainly prevail, nearly two-thirds of their whole number being located in that part of the country.

The Gadarias, the graziers of the country, are, as might be expected, found in all the districts, but more than half of them have their habitat in the Agra and Allahabad Divisions. They are found in largest numbers in the following districts—Cawnpore (42,053), Allahabad (37,922), Agra (36,324), and Allygurh (32,883.)

The Hajjams, as their occupation and duties imply, are evenly distributed in all the districts of the Province, and appear as a rule in largest numbers where the population is largest.

138. It is unnecessary to take up seriatim the remaining castes, but there are one or two points which attract attention. Not one of the least interesting politically is the fact that the Kukas appear to have found their way into this part of the country, and the Allahabad District shows 562 persons who are entered under this designation.

The religious mendicants and devotees number 242,086 against 195,656 shown under the same class in 1865. It must not, however, be understood from this that the numbers of these several castes have increased. It is more probable that the classification in the two enumerations has not been uniform. Twenty-four separate tribes are shown of whom the Jogis, Goshaens, and Bairagees alone attain high numbers. The first caste contains 72,050, the Goshaens 67,720, and the Bairagees 61,282.

Of the aboriginal castes, if the expression may be permitted, the most numerous are the Bhars, numbering 243,462, the main body of whom are found in the Benares division. They prevail mostly in Azimgurh and Ghazeepore, where half of the whole tribe have their abode. Above Jounpore they are rarely to be met with. The Gonds comprise 93,530 persons of both sexes, and like the Bhars have their chief habitat in the Benares Division. They are also found in a few scattered cases in some of the northern districts. The Kols, another indigenous race, rank next to the Gonds in number. Of the 27,943 persons recorded under this designation, 24,760 are found in the district of Allahabad and 3,136 in Banda, the remaining 47 reside in the Jaloun District.

139. The Mahomedan population is for the most part comprised under the three great heads of Sheikhs, Saiads, and Pathans, who stand thus :—

Sheikhs,	2,128,244
Pathans,...	537,391
Saiads,	152,965

For more than a million and a quarter no specific distinction has been recorded, 1,295,987 have been entered only as Mahomedans. Of the remainder, the Mughals include 37,216, and the descendants of converted Hindoos, Rājputs, Gujars, and Tug-gas make up 32,638, appearing chiefly in the Meerut Division and mostly in the Saharunpore District.

140. In the accompanying abstract is shown the composition of the Hindoo population in regard to caste :—

TABLE P.

District.				PERCENTAGE ON TOTAL HINDOO POPULATION OF—

XII.—The Occupations of the People.

141. Following the plan of the Census of 1861, the occupations of the people have been arranged in accordance with Dr. Farr's classification adopted for the English Census. But only males not less than 15 years of age have been entered in Statement VI., classifying the occupation of the people. The statement is certainly incorrect in regard to many of the professions and trades. This has occurred from the want of a systematic entry of the particulars of occupation in the original enumeration returns. Many persons, who should have found a place under a sharper defined designation, have been entered under the mere general heading "servants." In some instances the occupation has not been correctly given. It is preposterous to suppose that there is only one pleader in the city of Allahabad the main portion of whose income is derived from his practice, and yet the abstracts for Allahabad showed only one pleader in the occupation statement. Similarly with the water-carriers of the city of Allahabad, who are shown in the occupation statement as only six. They have most probably been entered as servants. Admitting, however, that there are many such inaccuracies in the occupations recorded, Statement VI. may be accepted as giving for all but the first class, "professional," a fair general idea of the avocations of the people.

142. Statement VI. and its supplement show that out of 10,352,592 males not less than 15 years of age, the six great classes of occupation into which Dr. Farr's classification divides the people contain the following numbers:—

Professional (class I.),	122,030
Domestic (class II.),	973,072
Commercial (class III.),	447,786
Agricultural (class IV.),	5,937,274
Industrial (class V.),	1,247,004
Indefinite and non-productive (class VI.),	1,625,426

It thus appears how largely the agricultural interests predominate over all others in this country.

143. On examining the statement in detail, we find the orders composing these classes to come thus:—

CLASS I.—*Professional.*

Order I.—Government servants,	8,717
„ II.—Engaged in defence of the country,	11,097
„ III.—The learned professions—literature arts, and sciences, &c.,	113,308

CLASS II.—*Domestic.*

„ IV.—Midwives (omitted).			
„ V.—Engaged in entertaining and performing personal offices for men,	973,072

CLASS III.—*Commercial.*

„ VI.—Persons who buy or sell, keep or lend money and goods of various kinds,	347,703
„ VII.—Engaged in conveyance of men, animals, and goods,	99,083

CLASS IV.—*Agricultural.*

„ VIII.—Persons possessing or working the land,	5,891,502
„ IX.—Persons engaged about animals,	45,772

CLASS V.—*Industrial.*

Order	X.—Arts and mechanics, ...	116,686
"	XI.—Textile fabrics and dress, ...	492,292
"	XII.—Food and drink, ...	229,781
"	XIII.—Dealers in animal substances, ...	26,023
"	XIV.—Dealers in vegetable substances, ...	140,772
"	XV.—Dealers in minerals, ...	241,440

CLASS VI.—*Indefinite and unproductive.*

"	XVI.—Labourers and others ; branch of labour undefined, ...	1,450,517
"	XVII.—Persons of rank or property not returned under any office or occupation, ...	2,274
"	XVIII.—Persons supported by the community and of no specified occupation, ...	172,645

144. This last order comprises in the present Census, as it did on the last occasion, occupations which would not be proclaimed in other countries. Some of those observed in the returns of 1865 have, however, disappeared from the statement for 1872. There are no "flatterers for gain" or "sturdy beggars" recorded on this occasion, and the vagabond who announced his calling as such in the Agra District has disappeared; but there are still 3,677 alms-takers, 1 gambler, and 30 bad characters, who, it is gratifying to find, are considerably reduced in numbers since 1865. The pimps, on the other hand, have increased their numbers to 558. There are 10 pedigree-makers, 75 jesters, 29 mimics, 98 astrologers, 41 charmers, 8 snake-charmers, 69 wrestlers, 1 diver, 405 tomb-keepers, 279 devotees, 359 almanac-makers, and last on the list comes 1 speech-maker in the Benares District.

145. Taking first the largest class (IV.), the agricultural, we find, out of the 22 occupations comprised in its two orders, the two headings, proprietors of land and cultivators, take up the bulk of the whole; and out of the 5,937,274 persons shown in this class, 5,871,931 are proprietors or cultivators of land and 15,246 more are ploughmen. It has already been indicated that the labouring population shown in the occupation statement as labourers should be included with agriculturists, as their labour, if not entirely, is mainly expended in agriculture.

146. Under the head of "labourers," Statement VI. shows 1,448,087 persons. These compose the great bulk of Class VI., which in numbers ranks next to the agricultural class.

147. Next in order in point of numbers comes Class V., "industrial." There are 181 different occupations shown under this class: 38 of these come under Order X. Two of them, carpenters and masons, comprise by far the largest portion of this order, numbering respectively 83,390 and 12,240. The only other comparatively large class shown in this order are the necklace-makers (5,731). Order XI. comprises 28 occupations, the most numerous of which are weavers (307,076), tailors (56,003), and cotton-cleaners (51,268). There are also 31,948 shoemakers and sellers in this order.

148. Under Order XII. are forty occupations, amongst which the grain-parchers and flour-dealers are most numerous. The other conspicuous trades under this order are butchers (19,038), greengrocers (12,719), pán-sellers (9,899), grain-dealers and sellers (19,046), and confectioners (15,281).

149. In Order XIII. thirteen occupations have been shown; but the following two, tanners (11,463), leather-sellers and dyers (12,593), comprise by far the largest number of persons under this order.

150. In the next Order, XIV., there are 29 occupations shown. Only three are conspicuous for the numbers following them. These are oil-makers (79,372), oil-sellers (15,037), and lac-workers (16,615).

151. In the last order included in Class V. there are 33 occupations, some of them giving employment to large numbers. There are, for instance, 80,529 potters, 72,579 blacksmiths, 48,043 goldsmiths, and 5,916 brass-vessel makers.

152. In Class II., which ranks next, there is but one order, Order IV. having been omitted as it relates only to females. There are 10 occupations recorded under Order V., and most of them are numerouslly filled. Most conspicuous amongst them is the column for servants, containing 625,106. The barbers number 124,259, and there are 70,803 sweepers, 78,895 washermen, and 67,589 water-carriers.

153. Class III. comes next in numerical importance. The two orders composing it contain 29 occupations. Of the 14 occupations under Order VI., one alone, shop-keepers (227,354), contains two-thirds of the persons under this order. There are 30,400 money-lenders, 23,217 merchants, 18,499 cloth merchants, 19,874 potty-dealers, 5,288 money-changers and 4,680 bankers in this order. It also contains 6,342 brokers and 4,517 contractors.

In Order VII., which contains 15 occupations, the most conspicuous for numbers are ekka and cart-drivers (15,052), carriers by bullocks (15,025), and carriers by ponies (6,310). There are also 15,287 load-carriers and 13,652 porters in this order.

154. In Class I., under Order III., the most conspicuous of the thirty-two employments shown are the following:—

Family priests or prohits (46,025), pundits (24,901), singers and musicians (7,504), temple or ghat priests (7,248), drummers (4,557), doctors (4,507), druggists (3,320), and dancing-boys (3,161).

155. Statement V. shows hardly any of the military, as they were not returned in the ordinary enumeration forms. It will be seen, however, from the footnote appended to para. 22 of this report what was the number of soldiers in the Province on the 10th January, 1872. They are given there at 5,029 Europeans and 6,063 Natives, so that the total of Order II. will be 11,095. The Census having been taken when the leave season for native soldiers is closed will account for the non-appearance of many men under this head of Statement V. It is not, however, to be believed that only five men were absent on leave; and these were only to be found in one district. It is probable the few men who were absent from their regiments at this season have been included in Order V. I have little doubt that all persons who recorded their occupation by the broad expression "service" (*nokari*), the usual mode in which Government servants among the Natives, whether civil or military, define their calling, have been included in an order to which they in no way appertain. But it was impossible to rectify this error in the enumerators' returns or in the abstracts. It is thus that the very small number of persons shown under Order I., Government servants, is also explained. There are several districts in which not a single Government servant has been recorded. In two entire divisions, Agra and Allahabad, not one solitary policeman has been shown. These facts condemn these entries in Order I. as worthless so far as giving any indication of the number of Government servants in the Provinces; but the accompanying table, kindly furnished to me by the Accountant-General, shows 95,258 persons in this order:—

		No. of Persons.
Collectors, Deputy Commissioners, and establishment,	...	7,082
Land Revenue, Settlement Charges,	...	4,991
Excise or Abkaree,	... { Commissioners, &c., Collectors, &c., }	479
Assessed Taxes,	...	46
Salt,	... { Collectors, &c.,... Assistant Commissioners, &c., }	3,428 1,033

Stamps,	60
Administration,	382
Commissioners,	180
Currency Office,	12
Meteorological Department,	22
Botanical Gardens,	132
Law and Justice,	5,025
Ecclesiastical,	171
Political Agencies,	7
Inspectors-General, &c.,	20
Central Jails,	651
District Jails,	1,007
Registration Department,	494
Government Railway Police,	482
Education,	1,050
Medical,	750
Police and Villago Chowkeedars,	67,754
Total,				95,258

156. It was thought possible to secure some information in regard to the employments of the women of the country. It was known there were very few cases in which females followed independent occupations; and this being the case, it was not anticipated there would be any difficulty in securing in these solitary instances the information desired. The result, however, has shown how extremely difficult it is in this country to obtain statistics on untrodden ground. Instead of entering independent employments followed by women, cases occurred where the abstractors, if not the enumerators, have merely recorded the occupation of the husband, and in one district two women have actually been returned as police, while in another instance two women appear as villago watchmen. These, with other cases equally absurd, have rendered it impossible to make any use of these returns, and they accordingly find no place in the occupation statements.

157. It is not pleasant to have to notice that only in the cases of Europeans has there been any attempt to treat the enumeration as a matter of ridicule. But as in Madras so here, the only instances where difficulties have been openly thrown in the way of the enumerators have occurred amongst our own countrymen, who have in a few solitary cases noticeable in the occupation columns attempted to display what perhaps to them appeared wit; and one young civilian has had the good taste to write himself down a Fenian in the nationality column.

XIII.—The Rural and Urban Population.

158. Statement VII. shows the number of villages and towns throughout the several districts in the Province classified according to the number of their inhabitants. A comparison of this statement with the similar return for 1865 shows a very large increase in the number of inhabited villages.

There are now 90,684 inhabited villages against 77,122 in 1865.* The increase has been mainly in the smaller villages, which, if we take those which have less than 500 inhabitants, and allow for transfers from Shahjehanpore and Jhansie, show an increase of more than 22 per cent., having risen from 61,749 to 75,432. But this increase on examination turns out to be more imaginary than real. It is attributable to the difference in the two methods followed in classifying villages in this and the preceding enumeration.

* These figures exclude Ajmere. In making comparisons between the tables for 1865 and 1872 it is necessary to remember, in regard to the number of villages, that Statement I. of the 1865 returns shows estates while Statement I.A. of this volume shows inhabited villages, and not estates.

161. Benares still heads the list as the most populous city in the Province with 175,188 inhabitants against 173,352 in 1865. The remainder of the cities with more than 50,000 inhabitants come in the following order :—

		1872. <i>Population.</i>		1865. <i>Population.</i>
Agra,	...	149,008	<i>Against</i>	142,661
Allahabad,	...	143,693	"	105,926
Cawnpore,	...	122,770	"	113,601
Bareilly,	...	102,982	"	105,649
Meerut,	...	81,386	"	79,378
Furruckabad,	...	79,204	"	73,110
Shahjehanpore,	...	72,136	"	71,719
Mirzapore,	...	67,274	"	71,849
Moradabad,	...	62,417	"	57,304
Muttra,	...	59,281	"	51,540
Allygurh,	...	58,539	"	48,403
Goruckpore,	...	51,117	"	50,853

In Mirzapore, which shows a decrease, the diminution is no doubt attributable to the decreased commercial activity of the town. In Bareilly I am unable to assign any reason for the decrease. It is surprising to find that Furruckabad, a city which is declining rapidly as a centre of trade, shows a considerable increase in population.

162. In Statement IX. a column has been given showing the number of persons to the acre. It is not altogether to be relied on, as in some instances district officers have not been able to give figures for the area on which the towns stood. Great care has been taken to bring it as close as possible to accuracy, and the density of the town populations is fairly brought out in the statement. There would appear from column 21 of Statement IX. to be 42 cases in which the density of the town population exceeds 80 persons per acre. In one instance the pressure is shown at over 200 per acre; in 15 cases it is given as above 100; and in the remaining 26 it varies between 100 and 80.

163. From the figures below, a clear idea can be obtained of what the density of population is in these 204 towns and cities compared with some London parishes :—

TABLE S.

Density of Population in London parishes.

	St. Pancras.	St. Marylebone.	St. George's and St. Giles.	Whitechapel Union.	St. Giles, Cam- berwell.	Fulham Union.	Paddington.	Islington.
Number of persons per square acre,	85·2	106·1	222·6	188·0	25·6	26·0	78·4	67·6

164. In the case of Meerut, where the density is given as over 200 per square acre, I think the area shown is that for the city, exclusive of the Sudder Bazaar, which is virtually a small city by itself, containing over 25,000 inhabitants. There is no doubt, however, as to the accuracy of the majority of the entries in column 21, and the high density shown in many cases is noteworthy. The rural population, however, as well as the residents in town are very closely packed in this country, and nothing more astonishes the new comer than the size of a purely agricultural village with a population perhaps approaching the limits in which it would rise to the designation of a town.

XIV.—Progress of the Population.

165. In Appendix E. will be found at length the opinions expressed by District Officers in regard to the causes by which the movement of the population has been affected. I shall not, therefore, examine the progress of the population so closely as was done in the report of 1865, when we were without any expression from the local authorities of their views in connection with this subject.

166. Allowing for the exclusion of Ajmere, we observe that the total population of the Province recorded in 1872 has increased 3·6 per cent. The males have not increased so much as the females, the figures being males 3·2 per cent. females 4·3 per cent.

It is probable that the difference in the progress of the two sexes is less real than apparent, and is attributable to there having been less concealment of the females on this occasion than at the previous Census. Turning to the different creeds of the people, a much more remarkable difference than that noted above is observable. The Hindoos appear from the figures to have increased 4·2 per cent., while the Mahomedans exhibit an increase of ·3 per cent. This, again, is I think in the main attributable to the erroneous mode in which in some districts the lower castes, who, as has already been observed, occupy the debateable ground lying between the two great religions, have been entered in the returns for 1865. The most prominent of these cases have previously been referred to, and there is no necessity for recapitulating them here.

In the Hindoo population there is a difference of ·9 per 1,000 in the rate of progress observable in the two sexes. This difference is in favour of the females, who from the figures appear to have increased 4·7 per cent., while the males of the same creed have increased only 3·8 per cent. With the Mahomedans also a similar difference favouring the female sex is noticeable, but it is somewhat less marked than is the case with the Hindoos, being ·7 instead of ·9 per 1,000. This difference between the rates of increase of the Mahomedan and Hindoo females lends further strength to the conclusion that it is the altered method of distinguishing the lower castes, among whom concealment of their females is not likely to prevail, which caused the variation in the rates of increase perceptible in the two great religious sections of the community.

167. Examined by divisions the following results appear :—

In five divisions out of seven the population has been increasing. Kumaon shows marked progress, the population in that division having increased 17 per cent. It appears to me, judging merely from acquaintance with Indian population returns, that a considerable portion of this paper increase must be due to incorrectness in one or other of the two enumerations from which I am now comparing the figures.

The Meerut Division shows an increase in its population since the Census of 1865 of 8·7 per cent. This is not opposed to probability, as Mr. Henvey's narrative of the drought and famine which prevailed in the North-West Provinces during the years 1868-69 and beginning of 1870 shows that, speaking broadly, the scarcity which prevailed in those years did not much affect this division. It is comparatively wealthy by the side of some of the lower divisions, and is fortunately placed in regard to irrigation and facilities for communication.

In the Agra Division the population has increased $7\frac{1}{2}$ per cent. Here, again, though the progress made by the population is somewhat more rapid than I should have looked for, there is nothing which makes it improbable. There was, however, more suffering here than was occasioned in the adjoining division of Meerut by the scarcity of 1869-70.

In the Rohilkhund Division population has increased 5·2 per cent. In parts of this division the scarcity of late years has had undoubtedly very depressing influences. Of Bijnour Mr. Henvey writes that the drought of 1868 changed anticipated plenty into bitter want. "The people ate nuts, weeds, and mangoe-kernels ground into flour;" and it is further stated that "mothers left their children," and that the Magistrate had been obliged to post patrols on the roads, after payment of the wages of the women

employed on the relief-works, to pick up any children who had been left. In Morádábád there was no great distress till July; but Mr. Henvey writes, "It was extremely sharp in August and September, being most intense at the middle of the last month." In Bareilly about the same time distress was severe, and reached its climax also in September. Regarding the physical effects of the famine in this district the Civil Surgeon has remarked, and here his observations corroborate what Dr. Cleghorn has already observed in this report, that two common results of prolonged starvation were lunacy and ulceration of the cornea, which latter, if not promptly arrested, ended in blindness. In Shalhjeanpore it is said the pressure occasioned by the scarcity of 1869 and 1870 lasted for little more than seven weeks, but during that time was extremely severe. In Budaon, which is reported to have suffered more from depletion of stores than from bad harvests: the severity of the suffering in July, 1869, may be conceived from the following remarks, made by the Collector in his confidential report:—"The rains having set in," he said, "the people would be able to collect wild bulbs and edible roots for food."

In the Benares Division the increase has not been so marked as in the more northern tracts I have referred to. Allowing for the altered form of this division, from which Jounpore has been taken and transferred to Allahabad, while the large tract of country which formerly composed the Goruckpore district (now the two districts of Goruckpore and Bustee) has been given to it in exchange, there is an increase in the population of 2·4 per cent. Azimgurh shows a steady movement upwards, the inhabitants of that district having apparently increased 10 per cent. I gather, however, from the Collector's remarks that the population in 1865 had been considerably understated, "through an apprehension felt at the time that the Census was intended as the basis of an arms assessment." In Mr. Henvey's report, to which I have so frequently referred, it is stated—"The Benares Division has not suffered from famine within the current century at least, but there has been considerable failure of crops and sharp suffering, especially in the Mirzapore pergunnahs south of the Ganges. Goruckpore and Bustee escaped almost entirely. In Azimgurh, Ghazipore, and Benares the high prices everywhere ruling towards the middle of 1869 discovered much distress." The figures indicating the numerical population in these districts are in accordance with the facts Mr. Henvey's remarks disclose. The Goruckpore and Bustee Districts combined exhibit an increase in the population of one and a half per cent. In Mirzapore there has been a decrease of three and three-quarters per cent. Benares and Ghazipore have remained almost stationary, and the increase in Azimgurh is said to be attributable, not to an actual increase in the population, but to the under-statement of the people in the previous Census.

168. Turning now to the two remaining divisions, where the population has decreased, it is observable that in Allahabad there is a diminution of the population of nearly but not quite one per cent. The exact figures are ·99 per cent. In Jhansie the decrease is more marked, and takes an exceptional shape. It is not exactly brought out in the figures of the Census statements, for it must be remembered that the 1872 figures in the case of Jhansie are taken from a slightly diminished area. The villages transferred to Maharajah Scindia contained 8,746 inhabitants. Allowing for this transfer, the population in this division has decreased by 67,512, having fallen from 1,002,446 934,934. Thus, the population has diminished very nearly 7 per cent., or more accurately 6·98.

169. In regard to this division, I extract the following remarks from Mr. Henvey's report. Of Jaloun he writes:—

"In the most favoured district of the Jhansie Division the year 1869 left its mark of distress, and it was not until the plentiful rains of 1869 had ensured an abundant harvest that apprehensions of a wide-spread calamity passed away. The agricultural population must have endured great hardships. In cattle alone they are calculated to have lost one-third by starvation. In many villages plough-bullocks were not procurable, and the soil was turned up by the hoe.

"The District of Jhansie is unfavourably situated in times of drought and famine. It has only one mart of importance, Mhow Raneepore, in the south-east of the district. It is flanked on the west and south by Native States, generally prone to throw obstacles in the way of a free trade: and during a considerable portion of the year the flow of supplies from the Doab, Humeerpore, and Central India is liable to obstruction by the swollen streams of the Betwa and Dessan Rivers. In the Pergunnahs of Goorserai and Mhow, towards the east, hilly tracts afford facilities for embankments and reservoirs, such as have reclaimed the jungles of Mhairwarra; but in the greater part of the district irrigation is wanting.

"The soil, moreover, is stony and sterile; and the people are apathetic and impoverished. The rain-fall of an ordinary season varies from 30 to 40 inches: in 1867, 45 inches fell; in 1869, 46 inches. The supply from June to the end of November, 1868, barely exceeded 14 inches, and that amount was unequally distributed: In June, 1·8 inches were marked; in July, 8·2; in August, 0·2; in September, 2; in October and November, none at all; in December there was a sprinkling, barely sufficient to moisten the earth; then, after a break of two months, came a fall in March, heavy enough to endanger the corn on the threshing-floors. This season of drought was succeeded by torrents of rain in the autumn of 1869;—roads were broken up, bridges were burst, and the country rendered impassable for weeks. Fifteen inches of rain fell in 36 hours at Jhansie during the last week of July. The effect of such disasters on the crops may be briefly told. The khurreef of 1868 was destroyed, save where the black soil, retentive of moisture, or irrigation from wells, secured some small remnant. The rubbee of 1869 was less than half the average.

"To a district thus partially deprived of its stock, the floods of 1869 were a crushing calamity. Before July, 1869, it was almost impossible to procure carriage, for the scarcity of water and fodder was an insuperable impediment. After July the roads and bridges were destroyed. Then occurred an absolute failure of food in the station of Jhansie and its environs. The shops in the city were closed, and Seindiah's Soobah declared his inability to aid. On the 27th July the Officer Commanding the station reported that his troops—Infantry and Cavalry—had not enough food for the next day's consumption. On the 28th idem the Deputy Commissioner urgently represented the necessity of making provision for the Native troops, jails, and poor-houses. Stores in the city were exhausted, or the dealers held back; imports, which had flowed in plentifully from the Doab and Central India, were stopped; the supply available in the district had come to end; wheat was selling at 6½ seers, but this was a nominal price, for no grain was to be bought in the city at any cost.

"Drought, floods, and failure of supplies were not the only evils that befell this unhappy country: sickness followed in the train of famine. Small-pox raged during the first six months of 1869: Sun-stroke carried off numbers of enfeebled wretches: according to the Deputy Commissioner 'men came in weary, and weak, and fasting, took a long draught of water, and fell down and died.' Cholera appeared with the rainy season of 1869, and fever of a malignant type—the usual attendant of scanty and inferior food—doubled the tale of victims. Twenty thousand three hundred and thirty-one people of Jhansie are reported to have died in 1869, compared with 3,180 in 1868. And the different diseases contributed as follows to the total:—

" Small-pox,	3,310
" Cholera,	1,794
" Fever,	8,043
" Dysentry,	382
" Diarrhœa,	1,194
" Starvation,	218
" Sun-stroke,	1,023
" Other,	4,267

Total, ... 20,331.

"A mournful feature in the Jhansie famine was the excessive mortality among the orphans who were brought to the poor-houses. The numbers were :—

Period					Average number.	Deaths.
May,	1869,	7	3
June,	"	31	1
July,	"	39	1
August,	"	72	8
September,	"	79	12
October,	"	100	41
November,	"	58	28
December,	"	30	6
January,	"	46	3
February,	"	21	2
					483	105

"This district is one of the few in the North-Western Provinces in which the traces of the famine are said to be still everywhere perceptible. Villages are thinned, and land to the extent of from 10 to 20 per cent. in the poorer villages has been thrown out of cultivation, owing partly to the loss of cattle,—150,000 out of 300,000 having succumbed to starvation or sunstroke; and partly to the spread of the destructive *kans* grass consequent upon the heavy rains of 1869. It will be a long time before the District of Jhansie recovers from the disastrous year 1868-69.

"Lullutpore is the poorest district in the Jhansie Division. Out of an area of 1,246,346, less than 250,000 acres are cultivated. The Pergunnahs of Talbehut, Bansee, and Banpore are sterile. The central and east central tracts of Lullutpore and Mehrownnee produce good crops. But Talbehut is a rocky jungle, and Muvowra Narhut to the south-east possesses little good soil. Irrigation is almost entirely wanting. There are a few wells and tanks, but the latter are liable to exhaustion in dry seasons. The most important line of communication is the Jhansie and Saugor Road, which traverses the district from north to south, and the Betwa River is said to form no obstruction. *Bajra* and *joar*, so common elsewhere, are scarcely grown at all in Lullutpore: next to '*kodo*,' '*kootkee*,' and other coarse grains consumed by the poorer classes, the principal rain-crop is rice.

"On the 29th July, 1868, the condition of the district seemed hopeful. Steady rain had fallen since the 21st idem; the wells were partly filled from the superabundant supply of the past year; fodder was plentiful; grain had fallen to over 14 seers for wheat; and agricultural operations were being vigorously carried on. Until the middle of August a fair khurreef was expected. Then, as no rain had fallen since the 10th August, and as the total fall since 1st June, 1869, had been far below the average, it was feared that the crops would be lost. In September the prospect was worse still: wheat was now 10½ seers, coarse grains very scarce, and work in the fields stopped. The most unfortunate parts of the district were the Pergunnahs of Talbehut, Bansee, and Banpore. There the khurreef had generally failed. In other pergunnahs the autumn crops seemed flourishing, and there was no danger of a failure of stocks, for grain was briskly imported from Jhansie, and the traders at Bansee and Lullutpore displayed a liberal spirit in agreeing to supply on credit grain which was to be repaid at next harvest. Towards the middle of September rain fell, but it was too late to save much, except the scanty *joar* crops. Rubbee sowings were, however, begun, and though non-agriculturists showed signs of distress, the rural population seemed pretty well off. Imports continued both from Jhansie and Saugor, but the coarser kinds of grain were not procurable. At the end of October wheat was selling at 12½ seers. Then ensued very dry weather, which destroyed the remaining hopes of the autumn harvest, and endangered the rubbee. The next change took place in the middle of December, when half an inch of rain fell. This rain did much benefit to the wheat and *gram*, and the hopes of the farmers were raised thereby, but the miserable non-agriculturists were worse off than ever. On Christmas-day wheat was at 12 seers,

joar nearly as dear, and *dal* a seer dearer. After this there was nothing very unusual in the season. Heavy rain fell towards the end of February and beginning of March, 1869. No damage was done, and eventually an outturn slightly above half the average was secured. Distress, however, increased to such an extent that even rural people were hard-pressed, and Thakoor zemindars expressed their readiness to work for bread. In April—that is, immediately after the harvest—grain became cheaper, and wheat could be got at 14 seers, but the people were so impoverished they had no hope of sowing the rain-crops unless Government would advance money for seed. Cholera broke out in June, 1869, and raged throughout the early months of the rainy season. The monsoon appeared about the 28th of June, and there was no further anxiety so far as concerned agriculture. But traffic was impeded, supplies fell off, and wheat rose to 9 seers in the second week of July. Nor was there any relief or perceptible diminution of distress until September, by which time the harvest promised to be abundant. During October a more marked improvement took place. Coarse grain was procurable at 32 seers for the rupee, and the demand for employment rapidly declined. By the 4th November, 1869, *kodo* was reaped, and *joar* ripening; all signs of hunger and suffering had disappeared. And thus ended the most calamitous year through which Lullutpore has passed during the current century.

“Notwithstanding all that was done, the district must have suffered terribly. Of 233,047 cattle, 95,543, or 41 per cent., died, and more than 7,000 were sold. Some were sent off to the Balabehut jungles; others were driven to shift for themselves in the fields, and others were kept alive by browsing on the withered *joar*-stalks. The change to abundance of grass and water upon the setting-in of the rains in 1869 is said to have destroyed large numbers; and the stench arising from thousands of carcasses polluted the air, and contributed to the outbreak of cholera, which was the last plague that visited the district.”

170. These extracts pourtray in colours not too black the terrible sufferings the people of the Jhansie Division underwent in the long-to-be-remembered year 1869-70. They sufficiently explain what have been the causes at work to produce a decrease in the population of the three districts composing the division. The rate of decrease in the seven years which have intervened between the present and the last enumeration, is given below :—

Lullutpore,	14·3 per cent.
Jhansie,	8·8 ”
Jaloun,	0·3 ”

171. In the Allahabad Division, where the decrease in the population does not exceed one per cent., the state of the several districts during the years 1868-69 may be gathered from the following extracts :—

Of Cawnpore Mr. Henvey writes—“The agricultural population were fully employed and suffered no hardships: while railways, canals, imperial roads, and trade provided so much demand for labour that the condition of the non-agricultural classes remained satisfactory throughout. Of scarcely any other district can the same be said.” Taking the district as a whole, “Futtehpore must be excluded from those in which there was any true famine.” In Allahabad “it was only in the Pergunnahs of Barah and Khyragurh that famine can be said to have prevailed. There the sterility of the soil, the drought, and the miserable condition of the people* combined to create very severe distress.” * * “The District of Jounpore suffered severely from drought; but famine was averted by the heavy rain-fall in September, 1868. * * There was no

* The population of Barah, which adjoins Khyragurh on the west, suffered from paralysis, occasioned, it is said, by eating a poisonous grain, called *hesaree dal*. This terrible malady, though not of course peculiar to a season of famine, was a serious aggravation of the poverty and distress that prevailed in these tracts. The late Commissioner of Allahabad, Mr. M. H. Court, after a visit to the Meja Poor-house in Khyragurh in December, 1869, gave a most lamentable account of the inmates:—

“The rooms,” he wrote, “both within and without the walls are filled with beings, some of whom are unable to move except on their hands and knees, and that with difficulty; the best of them are scarcely able to walk with the aid of crutches. They are chiefly males adult, women and children forming a very few exceptions. They form but a small percentage of those afflicted by paralysis, but they were represented to be those most afflicted by poverty as well as disease, and most of them were homeless and friendless.”

general distress. * * "Humeerpore," it is stated, "or at least great part of it, must collapse in times of severe drought, because the country is without means of irrigation;" and it is added, "that the sufferings of the people of Humeerpore were intense there can be no doubt." Mr. Adams wrote that—"Grain has to a great extent disappeared as a chief staple of the diet of the poorest classes, and for some time past even those above the poorest have largely substituted other things for it."

In Banda, it is said, "Distress was the result of a partial failure of the spring harvest of 1869, following two unfavourable autumn crops in the years 1867 and 1868." The khurreef crop of 1868 was greatly injured, and "the outturn of the whole was not more than one-half the average. * * Cotton was an entire failure, and the loss had greatly impoverished the people. *Joar* and *bajra* had yielded some return, and the influx of these grains into the markets had relieved pressure; but the rubber area was less than usual, and the sowings late. They were not completed by the first week in December; and, besides, an epidemic fever, that lasted until late in November, 1868, had prostrated the people, and prevented them from proceeding with agricultural operations. The consequence was, that over large tracts corn could only be seen on near view, whereas the fields should have been a mass of green."

172. These extracts furnish a fair idea of the possible effects the scarcity in 1868 and 1869 might have exercised on the progress of the population in the Allahabad Division. The figures which the enumeration of 1872 has produced do not entirely coincide with the varying conditions and circumstances depicted in Mr. Henvey's remarks for the several districts. Cawnpore, which appears from the Famine Report to have suffered less than any of the districts in the Allahabad Division, shows an apparent falling off of 2·8, greater in fact than any of the other districts except Banda. There are doubtless other causes to which we must look for the differing results in the different parts of the Allahabad Division, and the opinion of the Local Officers in regard to the movement of the population will throw light on what these causes are. They are given in full in Appendix E.

XV.—Miscellaneous.

173. The number of persons to each enclosure and house will be found in Statement T.A., and in the subjoined abstract the figures for 1865 and 1872 are compared, excluding the districts which were not given in 1865 :—

	Average, ...	7·27	4·73	7·05	4·71

The number of persons per enclosure continues much the same now as was shown in 1865, the average for the Province being 7. It varies, however, considerably in different parts of the country.

174. I do not consider any good results can be obtained by entering into a comparison of the average number of persons per house. It is evident from the remarks of District Officers in Appendix E.—indeed, the statements themselves bear evidence on this head—that in a large number of instances a very different method has been followed in the enumeration of houses. In some cases while at one Census only inhabited houses have been counted, in the other enumeration uninhabited houses have also been shown. It is thus impossible to analyse figures drawn from such a shifting basis. It is to be hoped that on a future occasion it will be distinctly laid down that every separate house, whether inhabited or not, as long as it is intended for human habitation, shall be entered in the enumeration records. It is useful to know the number of uninhabited houses, and if they are recorded along with the inhabited dwellings, and are entered in a separate column, a further test is furnished for examining the correctness of the original returns.

175. In the Census for 1872 a distinction has been drawn between the houses built by skilled labour and those not so constructed. As there are many cases where the mud houses of the better-class zemindars are really far better dwellings than the dilapidated brick-built houses in some of the villages and towns, especially in the quarters inhabited by the impoverished descendants of old Mahomedan families, the number of houses of either description does not give an altogether accurate indication of the comparative affluence or prosperity of the persons who reside in them.

In the Kumaon Division, where the larger number of houses is found in the column devoted to those of the better sort, the physical character of the country—where stone is abundant, and it would be far more expensive to erect mud-houses than to construct rubble-shells—at once explains figures which might lead to erroneous conclusions were not this fact kept in view.

176. Excluding Kumaon, the number of houses classed as of the better sort is 400,886, and the number of persons living in them is 1,846,313; of the inferior sort the number is 5,823,289, and the number of residents in them is 28,179,573. It would thus appear that the average number of persons residing in each house of the better kind is somewhat less than the average number of persons residing in each house of the inferior sort. The figures for all the divisions are given below:—

T A B L E V.

Average Number of Persons to each House of the better and inferior kinds.

Division.					Per house of better sort.	Per house of inferior sort.
Meerut,	4.9	4.8
Rohilkhand,	4.7	4.8
Agra,	4.2	5.0
Jhansie,	4.9	4.4
Allahabad,	4.4	4.5
Benares,	4.6	5.1
Kumaon,	5.5	5.5
Total per house of better sort,					4.6	4.8

It would appear from these figures that, taking both descriptions of houses all round, there is very little to choose between the two, and there is nothing to indicate that houses of a really superior description only have been distinguished from those of an inferior sort.

XVI. — Concluding Remarks.

177. I must now bring this report to a close. I have endeavoured in the remarks that I have made to illustrate as much as is in my power the condition of the inhabitants of this Province, in so far as that appears from the figures in the enumeration statements. There are many topics which I have not attempted to go into, either because they have formed the subject of previous discussion in the former report for the North-West Provinces, and it would have been a waste of space to repeat again arguments and illustrations already before the public, or because the facts elicited in the enumeration of this and other Provinces have let in sufficient light upon them. I have, however, in some of the latter portions, been compelled to confine my remarks within smaller limits than I should have preferred to select for a complete treatment of the subjects with which they deal. To compile the statements, tables, and abstracts contained in these three volumes of Census results involved constant poring over the figures of the voluminous original returns. This has unfortunately so much injured my eyesight as to compel me to make use of an amanuensis for the greater part of the latter portion of my report; and my consequent inability to examine personally the statements with which I had to deal has forced me to be less copious in illustration, and to deal more briefly than I should have desired with portions of the subject which might with advantage have been treated more at large.

178. The Census Office opened on the 20th of May, 1872, and closes on the 15th of November, 1873, having been nearly eighteen months in existence. For three months of that time I was away on leave, and though the office establishment, then considerably reduced in numbers, was kept up for the three months (May, June, and July) of my absence, my services are only chargeable to the Census for fifteen months out of the eighteen during which the office remained open. From the 1st of February, 1872, to the 10th of May, 1872, the Census work was conducted by me along with my ordinary duties as Collector and Superintendent of Settlement in the Meerut District. Since the first commencement of the preliminary work in February, the correspondence of this office has numbered 3,635 letters.

The cost of the compilation of the Census Report and Statements may be thus detailed:—

	Rs.	a.	p.
1. Expenditure on abstracts in district offices, ...	34,327	8	6
2. Contingencies in district offices, stationery, postage, &c., ...	2,685	11	9
3. Pay of Central Office establishment, ...	51,515	6	6
4. Contingencies do. do., house-rent, stationery, carriage of records, postage, &c., ...	5,956	7	2
5. Deputation allowance of officer acting as Collector of Meerut for 15 months, ...	12,990	0	0
6. Preparation of Infanticide Returns in district offices, ...	1,497	7	5
7. Ditto ditto Central Office, and translation, ...	6,444	10	2
8. Assigned by the Revenue Board for the expenditure incurred in taking the Census, ...	7,000	0	0
9. Forms and printing (say), ...	40,000	0	0
Total, ...	162,417	3	6

Of this sum Rs. 7,942-1-7 do not form, properly speaking, a charge against the Census assignment, this amount having been expended in the preparation of Volume III., which was compiled for the Infanticide Department. The charge for forms and

for printing the report is only approximate, but the whole expenditure, including cost of compiling the sex statistics, will not, it is believed, exceed Rs. 1,70,000. As the preparation of the Age Returns has increased the labour of compilation tenfold beyond what was required in the case of Bengal, where the population is only a little over twice that of this Province, the charge incurred here will compare favourably with the expenditure there. In Bengal the total charges connected with the Census are put down, for a population of sixty-six and three-quarter millions, at Rs. 2,16,000; in the North-West Province, for a population of thirty and three-quarter millions, a work involving tenfold labour, will have cost less than Rs. 2,00,000. The charges for the Census in England were as follows:—*

Year.	Amount expended.	No. of Local Officers.	Population.
1841, ...	£56,727	35,159	15,914,000
1851, ...	£94,132	33,424	17,928,000
1861, ...	£93,719	33,966	20,066,000

179. For the benefit of those who may afterwards have to undertake the duty which has now been entrusted to me for two successive enumerations, I put on record the following suggestions in connection with (A.) the mode of taking any future Census, (B.) the mode of compiling the Census statements and returns, (C.) the subjects which ought to form additional matters for enquiry on any future occasion.

A.—The number of enumerators should be largely increased. Up to the present time they have not been sufficient for the work. For the present form of enumerator's return should be substituted single sheets for each house,—a copy to be left at the preliminary Census with the householder, and a duplicate to be retained by the enumerator.

The effect of this will be very much to lighten the labours of the enumerator at the actual Census, and further to diminish the chances of mistakes in the compiling office from the alterations which have to be made in the original returns when persons present at the date of the preliminary Census are afterwards absent when the final enumeration is effected; or conversely, when visitors are present on the final Census who were not in the locality at the first enumeration.

If persons are present at their houses on the night of the final Census who were not recorded in the sheet for the preliminary Census, it will only be necessary for the enumerator to add a supplemental sheet to that belonging to the house in question, giving to it the same number as belongs to the house, and marking it with the word supplement (*titumma*). If, on the other hand, one of the persons entered on the enumerator's sheet is absent on the night of the Census, it will only be necessary for the enumerator to run his pen through the entries against that person's name.

These sheets should, I think, be modelled much more closely on the form in use in England than have been our enumeration returns.

B.—It is absolutely necessary, if the possibility of error is to be avoided as far as is practicable, that the original returns, whether they take the shape I have recommended or not, should be condensed in the Census office. This was suggested on the occasion of the report in 1865, but there were circumstances which stood in the way of the adoption of this procedure. The extent to which error may be multiplied by a second transcription, without recourse being possible to the original papers so as to verify figures which appear strange or to remedy mistakes which may have occurred, will be very much narrowed if this mode of compilation is adopted.

C.—I have already suggested that in any future enumeration it will be advantageous to omit the record of castes. I think, as has been previously observed, that this information could be obtained with greater prospect of accuracy if the enquiry into this matter were separated altogether from the numbering of the people.

In the place of this information I would attempt to cure a defect I have noticed in the report for 1865 and in the present volume—I mean the omission of all information in regard to the civil status of the people. This information, if we can procure it, will throw considerable light on matters in which at present we are very much in the dark.

180. There are two other points I wish to advert to, which, though they do not spring immediately out of the subject of this report, are yet kindred to it. I allude to the formation of an organized local statistical bureau, and the introduction of some system which shall provide officials with the means of comparing the results of their own investigations with the outcome of European inquiry in the same department.

181. In 1866, after the compilation of the Census of 1865, the Board recommended, on my suggestion, that a small statistical department should be added to their office. There was a difficulty in providing the funds, and the subject was dropped. Had there been such a department in existence when the present Census was taken, a great economy would have resulted to Government. The whole of the preliminary work, and of the compiling of the Census statements, might have been effected at a much smaller cost; and a department, educated to deal with statistics, would have at once detected and grappled with sources of error which escaped the untaught clerks employed on this occasion till it was too late to remedy defects which might otherwise have been cured at the outset.

182. An equal advantage would be secured to the Administration if a certain number (say five for each Local Administration) of the European reports on matters which form the subject of inquiry in western countries were sent out for reference. It often happens that officers dig out figures, and with great labour deduce conclusions which have been anticipated in European reports on the same subject. It sometimes, too, occurs that, in consequence of their not having the means of referring to European figures, they make mistakes regarding the latter which quite invalidate their reasonings or throw them off the true line of enquiry. Not long ago the head of a department, whose business brought him into contact with figures connected with birth-rates, was with difficulty brought to believe that the English birth-rate was not the highest in Europe. Had he had the means of referring to English or French figures this was a mistake he could not have made. The errors such a mistake might have led him into may be easily imagined.

183. If a few copies of the ordinary statistics of the English public departments were sent out to the headquarters of each Local Administration, and if these were supplemented by the reports furnished from our own legations in regard to the agricultural tenures and material condition of European populations, any officer who wished to ascertain for himself how his figures stood by the side of those prepared in Europe could have no difficulty in doing so; and I think the advantages which might be anticipated from such a system would far more than counterbalance the expense.

ALLAHABAD :

W. C. PLOWDEN.

You have asked for an expression of opinion of some of the discrepancies, and have called generally for any remarks in respect of the Census which I may think apposite. In the absence of all tabulated statements except the one, which I now beg to return, I do not think that I could give an opinion of any value. I have accordingly considered it advisable to confine myself to a description of the *modus operandi* adopted in carrying out your instructions, and those of the Board, in respect of actual enumeration, and to explain, as far as I can, the causes for the discrepancies which you have indicated.

I have this day, in a separate letter to your address, explained how the instructions for enumeration were carried out; and I shall now briefly allude to the points raised in your letter under reply.

Your para. 2.—There has been great progress in the district in wealth and population undoubtedly. The area under cultivation has increased, and the increase in population outturns it. Peace, absence of plague or famine, fair harvests, better security for life and property, have all had a share in producing this result. The security for trade and the enhanced value of exports, edible or not, have also helped to augment population. There is ample room for further progress, as the edible ordinary outturn of the district could sustain, according to my calculation, an additional population of over five lakhs; while the extension of irrigation consequent on the construction of the canal will, within the next fifteen years, enhance production by 23 or 24 per cent., and probably still further affect population. It is also to be recollected, that since 1865 there has been a season of almost uninterrupted prosperity, while the Census of 1865 came close on the heels of a period of war followed by a merciless famine. The increase in the number of houses and in the population will not correspond merely with the increase in the cultivated area, but is as much connected with security for, and augmentation of, trade, as with area under cultivation.

Your paras. 3 and 4.—It is impossible to say now whether the same process was adopted in 1865 for the enumeration of houses as that which was followed in 1872. The instructions given in the former year would seem to have been exactly similar to those issued in the latter year. Possibly the experience gained in 1865 has rendered the recent Census more accurate. In this Census an uniform procedure was adopted throughout the whole district, and if different results are obtained in different paragnas, as for instance in Sahawar, which you bring to notice, we must look for the causes elsewhere than in the method of enumeration observed.

Thus in Sahawar the population is said to have increased 16 per cent., and the houses to have decreased by 12 per cent. I think that this apparent anomaly is capable of explanation. In Sahawar, at the Census of 1865, the population per house according to the figures does not average 5 per house, whereas the population of the district at that time is shown to have averaged above 5 $\frac{1}{2}$ per house. Now in Sahawar the Mussulman population was at that time 16 per cent. of the population of the paragna, and while it is obvious that Mahomedan families are not subdivided into so many "houses" as Hindoos, as there are fewer separate *chodas* among them, there was no reason why the paragnah population should be fewer in proportion to the houses than elsewhere. On the contrary, there was every reason why the population should be greater in proportion to the houses than elsewhere, where the Mahomedan element was smaller. I cannot answer for the figures of 1865 in respect of the houses. The Mahomedan population of Sahawar in 1872 is a little over 16 per cent. of the whole paragnah population, while the percentage of the district population of Mussulmans to the whole district population is 9 per cent., and the proportion of inhabitants to a house in the district is 5 $\frac{1}{2}$; we would therefore, in a paragnah where the Mahomedan element is 16 per cent, expect to find the population per house greater, and not less, than in 1865, and the result for Sahawar is so for 1872. My argument is borne out in those paragnahs where the Mahomedan element is high, as in Murehra and Putalee.

7. *Your para. 5.*—It is impossible, without much more information and many more returns than the one received, to say anything that would assist you in any way. I can only say with confidence that we have striven by method and example to obtain for you the most accurate statistics attainable, and that I believe we have succeeded; but the results of our efforts are tabulated in your office, and, with the exception of the form received, are unknown to us. Nor in any case could any judgment be formed on individual and district figures comparable to that which can be formed by you, who have all the returns and tables present.

8. *Your paras. 6 and 7.*—The female sex has somewhat progressed for the whole district.

In 1865 the numbers were—614,411 whole population,

272,077 females, or 44.20 per cent.

In 1872 the numbers were—703,485 whole population,

320,739 female population, or 45.50 per cent. or a

little over 1 per cent. increase. When we take into account the comparatively greater effect that the famine which followed the mutiny must have had on the weaker sex, and the comparative absence of anything to disturb the natural proportion and rate of progress of women in the past seven years, and the small increase after all this is found, I do not think that there is anything surprising in the figures;—1 per cent. is not a large increase. But when we come to the units in the calculation, such as Sahawur and Buderiya, to which you have drawn attention in your 7th para, the proportion seems large. Still it is capable of a simple enough explanation.

In Raizpoor Buderiya the nominal increase of women is 20 per cent.

For 1872 the pergunnah population is, 24,300

The female population, 11,157

The percentage of females is, 45.9

while the district percentage of females is 45.5. The present returns are therefore probably correct. So in Sahawur. The nominal increase of women is 27.2 per cent.

For 1872 the whole population of the pergunnah is, 44,433

The female population is, 20,719,

but the proportion is 46.6. This is little in excess of the district average, which is 45.5, while the percentage of the Census of 1865, giving population, 38,067,

women, 16,286,

or a percentage of 42 women, is, I think, incorrect, at least it is opposed to all experience, especially in a pergunnah where the Mahomedan element is larger than usual.

9. *Your para. 8.*—The Mahomedan community has increased more rapidly than the Hindoo. The Mahomedan element stood in 1865 in the proportion of 9.1, and in 1872 it shows in the proportion of 9.5 to the whole. Viewed in this light the increase is trivial. But I cannot account for it.

I beg to return the enclosure of your letter.

R. T. HOBART,

Deputy Collector.

JALOUN.

No. 285, dated Orse, the 16th May, 1873.

2. The report of Mr. White is submitted.

3. The difference in the cultivated area is no doubt to be attributed to the more exact re-measurements of 1872, also to the light assessment made in 1861, more land having been brought under cultivation.

4. The mode of counting the houses was the same as in 1865, but in 1872 perhaps the term houses was more strictly limited to houses actually inhabited, without reference to sheds for cattle, &c.

5. The deficiency in the total population is very small. The famine of 1869 caused emigration to the Deccan and other parts of India, leaving often the female members of the family behind, which may account for the excess over males. I do not think the Infantimide Act had much to say in the matter.

6. The fluctuations in the great sects of Hindoos and Mahomedans are too slight here to venture on any explanation.

7. The Census of 1872 may have been more accurate than that of 1865, but it is strange that the present Census should return the population of the district below that of 1865, and that after seven years of prosperity with the exception of one year only (1869). It is evident to the eye even that the population has increased considerably within last fifteen years; building is going on in most villages, and there is an appearance of comfort among the people which was not seen before.

8. The comparative statement is returned as requested.

A. H. TERNAN, COLONEL,

Deputy Commissioner.

No. 236, dated the 26th April, 1873.

In reply to his No. 234, dated the 25th instant, has the honour to state that the increase to the cultivated area in the Census of 1872 is the result of the re-measurements. At the Census of 1865 the measurements were in progress, but not finished.

2. In counting the houses, the procedure prescribed, Board's Circular No. U.U.U., dated 30th September, 1871, para. 2, was followed. The old file will show whether the procedure of 1865 was the same, but it is believed it was.

3. The deficiency in the total population is so slight as hardly to need notice; males, however, have decreased by 2·2 per cent, while females have increased by 2 per cent. The former may be due to the emigration caused by the drought in 1868-69, the latter to the more eager registration of females prompted by the Infantimide Repressive Rules introduced the year before in the district. In 1865 there was no such accidental stimulus, and there was probably therefore some under-registration of females. Logically the Infantimide Rules ought to have had little to say to the question, but then the native mind is pre-eminently illogical in taking alarm and jumping to conclusions. These reasons are of course purely conjectural, but from the nature of the case it seems impossible to offer any positive key to the discrepancy.

4. As to the fluctuations in the Census of Hindoos and Mahomedans, submits that if these were analysed by pergunahs, perhaps pergunah officers might find it feasible to assign approximately correct reasons in explanation.

5. The original accompaniments are returned as requested.

P. J. WHITE,

Settlement Officer.

J H A N S I E.

No. 228, dated the 12th November, 1872.

In reply to his No. 1008, dated 23rd September, 1872, begs to state that during the famine year of 1868-69 an immense number of people, chiefly belonging to the agricultural classes, left the district under the erroneous impression that the effects of the famine had not extended to Malwa, Bhopal, &c. Many of them perished on the way, and others settled elsewhere,—only a small portion returned.

The agricultural population is, I am of opinion, rapidly recovering from the losses it then sustained. The decrease in urban population is, I think, mainly due to the decrease in trade resulting from the isolation of Jhansie, brought about by the opening of a new line of traffic through the Central Provinces to Bombay.

Further, that a population of 11,221 has been decreased by transfer of 22 villages to Maharajah Scindia in 1871.

F. W. CHARTERTON,

Assistant Commissioner.

L U L L U P O R E .

No. 118, dated *Lullutpore, the 12th March, 1873.*

In reply to your letter No. 2680, dated 24th February, 1873, forwarding certain statements showing the results of the Census operations of this district for 1872 as compared with the results of 1865, I have the honour to reply as follows.

2. Regarding the decrease in the population of the district, I must in the first place inform you that the Census of 1865 was taken through the tehseldars and putwares mainly, and was found full of mistakes and returned for correction, hence I am not prepared to admit that the figures showing the Census of that year are correct. The Census of 1872, on the other hand, was carried out in a systematic way, and I feel sure that the results thus arrived at show the population as nearly true as it can ever be.

Again, the famine of 1868-69, succeeded as it was by heat-apoplexy, cholera and an epidemic fever of a most fatal kind, would fully explain the falling off in the population. Moreover emigration too into Malwa must be taken into consideration as accounting for a portion of the falling off. Undoubtedly certain portions of the district suffered more than others, and this is fully shown by the results in your own office statements, wherein the Raupoor Pergunah shows a falling off of 12,179, and Talab-but, 8,078 souls. These two pergunahs suffered the most; next came Lullutpore and Bansie; then the pergunahs in the south of the district. The increase in the Mahomedan population noticed by you is explained as follows:—

There are Mahomedans in the amlah now that we had not in 1865. These have their retainers and servants. Again, there are three large respectable Mahomedan families, with their complements of servants, in the district now, that we had not in 1865. These are the Tehseldars of Lullutpore and Mehranie, and the Deputy Inspector of Schools, who have a number of people depending on them. These have increased our but small Mahomedan population.

3. Regarding your remarks as to there being no falling off in the cultivated area of the district, but on the contrary an increase in the Lullutpore Tehseelee in 1872 as compared with 1865, though a falling off in the population, the matter I can only explain by the fact that settlement was in that year proceeding, and ground was allowed to lie fallow; or the year previous to Census the fall of rain was very light, and a good deal of putro soil was no doubt thrown out of cultivation which would have been shown in the returns for 1865. The soil of the Lullutpore Tehseelee is chiefly putro soil, while in Mehranie Tehseelee the land is all motee. In that tehsseelee the light rainfall was favourable, and in those pergunahs no falling off appears.

4. Your paragraph 6, in regard to the falling off in the number of houses. This is simply due to the emigration of 1868-69. People who went away then have not returned to this day. Hence the falling off in the number of houses. Undoubtedly all the uninhabited houses were left out of the Census of 1872, because it was laid down in the Board's instructions that the Census should be taken per *choolah*, not per house.

A. G. DAVIDSON, COLONEL,

Deputy Commissioner.

C A W N P O R E .

No. 332, dated *Campore, the 27th May, 1873.*

In reply to your No. 2999, dated 30th April, 1873, para. 3, I beg to say that the figures in the comparative statement you have sent me (which I return as requested) show a decrease in the population of the district in respect of every subdivision in the table (for the entire district), except in that for Mahomedan females.

The total diminution is 33,423, while the number of houses has diminished by 5,057; if we allow five persons to each house, this gives a population of 25,285, being not much less than the recorded diminution of the population.

There are however two considerations which make any inferences from these figures conjectural, one is,—that the Census of 1865 is known to be in many respects inaccurate, and the Census of 1872 to have been taken with a great deal more care than the former; the diminution of population may therefore be only apparent. The diminution is only 2 per cent. on the total population, and is not more than may be looked for in the margin for error which tables of this kind must necessarily contain. I do not therefore think that it is of much statistical importance, except from this point of view, viz., that the difference between the figures for each Census being almost entirely in the direction of a decrease, and not an increase of population, it is probable that there has been some slight actual decrease.

The other consideration is, that the return for houses, either in the Census of 1865 or 1872, does not represent houses, but in reality families. The "houses" at each Census were counted in the same way, that laid down in para. 22 of Circular No. E.E.E., dated 10th August, 1871, and para. 4 of the instructions to enumerators issued with Circular No. U.U.U., dated 30th September, 1871.

It will be seen from the context of those paras., that each family living in the same house will be credited with a separate house. If therefore there are, in the words of the instructions, six families, say two brothers with two married sons, each living under one roof, the edifice they inhabit will have been entered in the Census as six edifices. Conclusions, therefore, drawn from the relation between population and houses are not trustworthy.

The cultivated area of the district has increased by 15,536 acres. If we allow 1.64 persons to an acre of cultivation, this increase represents the labour of 25,579 men, women, and children.

No doubt much of the increase of cultivation is attributable to an increasingly active husbandry, the results of high prices and the pressure of numbers on a limited field of subsistence, and does not represent any large actual increase of population; but at the same time this increase of cultivation would, I think, tend to correct the impression that the population of the district has decreased by more than the number of persons who are required for the cultivation of this extended breadth of the land brought under crop. I therefore think it unlikely that any appreciable variation in the number of the population of the district has taken place, and it would be fruitless to speculate on the figures showing variations in detail for each pergunnah. There are besides no means of ascertaining what the causes are of the trifling variations shown in each column of the table, supposing these variations to exhibit actual facts.

C. J. DANIEL,

Collector.

P U T T E H P O R E .

Hutlagoon, Kutta.—The reason of any increase in any column of 1865 over 1872 is alleged by the canoongoe to have been the fact that people were staying in the pergunnah then who were not there in 1872; the opposite is explained in similar manner.

Ghazepore, Muthum.—That the decrease of 1872 over 1865 is accounted for by bad harvests, a succession of which has caused a large male emigration.

Aysal.—That the increase of 1872 arises from the greater number of guests then in the village.

Ekala, Dhata.—That upon the whole there is no difference, which requires no explanation; and that if there is a difference in the two Censuses, it is caused by births and marriages occurring in greater or less abundance according to the different circumstances attending different years.

Bindke, Kutiyagan.—That the reason of 1865 being in excess of 1872 was, that when the former was made there was on foot a festival which attracted a large number of strangers not found in the next Census.

W. LAMBE,

Assistant Collector.

Dated the 24th February, 1873.

Pergunnahs Bindke and Kutiyagan.—I have long been aware that a general decrease of population is going on in the western parts of this district. The decrease in the town population is explained by the decadence of such towns as Bindke, and the rise of Cawnpore, but I can offer no explanation as to the decrease of the agricultural population. The settlement has been a heavy one, and this may perhaps account for a certain amount of emigration. The Settlement Officer tells me that the cultivating classes in the adjoining pergunnah of Rutehpore are below the mark in numbers. Besides this, the figures of the 1865 Census may be untrustworthy.

Pergunnahs Dhata and Aysal.—I am unable to offer any opinion with any confidence. It will be seen that the general rise of population is pretty considerable in these two pergunnahs, the decrease being only noticeable in the agricultural (Hindoo) population. This decrease I ascribe, but with hesitation, to the severity of the present settlement, which tells only upon the Hindoo villagers. A reference to the Settlement Officer might perhaps be useful, and an examination of the medical returns (*quoad valent*) is of course necessary. I believe the famine of 1868-69 fell on this district with comparative lightness, and, so far as I know, the health statistics are about the average.

Pergunnahs Muthum and Ghazepore.—The noticeable feature of this return is the general decrease of the agricultural population, both Hindoo and Mahomedan, and the general increase of the non-agricultural. I believe the somewhat heavy settlement was the cause of the former, these two pergunnahs having felt it especially; and that the general improvement of the country in wealth, and the means of making wealth, may failily be credited with the latter. Large numbers of Thakoor and Brahmans are continually losing their zemindarages, which are bought up by absentee speculators.

Pergunnahs Hullyagan and Kula.—I am unable to offer any good opinion on these returns. It may be that the settlement has rested lighter on these two pergunnahs than on the southern and south-western parts of the district. The large Mahomedan population here shows no signs of decrease, which is probably rather contrary to the facts observed elsewhere.

J. WHITE,

Assistant Collector.

Memorandum on the alleged decrease and increase of the population in the different pergunnahs of the District of Rutehpore.

1. As I have been requested by Mr. Plowden to make any remarks which may occur to me on the correctness of the opinion given by Mr. J. White, Assistant

Collector of Futtehpore, on the differences observable in the Censuses of 1855 and 1872 in the District of Futtehpore, I offer the following observations.

2. I have obtained the figures of the 1872 Census from Mr. Plowden's office, and they show a total decrease of population of 17,071 : there is a decrease in the two western and the two central tehseldars, and an increase in the two eastern of 899 and 2,557 respectively.

3. Mr. White says—"I have long been aware that a general decrease of population is going on in the western parts of this district." I do not know over what portion of his stay in the Futtehpore district Mr. White's observations on the decrease in population have extended, but even if they were commenced immediately after his arrival and continued down to the date of his memo. (24th February, 1873), they only lasted over a period of 1½ months, which might perhaps be considered by some a rather limited time for extensive observations on so intricate a subject, and one requiring such a series of careful tests extending over many years.

4. I mention the shortness of Mr. White's stay in the district, as his observations may for this reason be thought perhaps not to possess the value and authority they would otherwise doubtless have.

5. I myself was in the district for a somewhat longer period than Mr. White, viz., from November, 1863, to April, 1871 (7½ years), and I was in continuous executive charge of these very pergunnahs during the whole time; but I would not venture to express any decided opinion as to whether the population increased or decreased during that time, although all the observations I was able to make tend to lead me to a different opinion from Mr. White, who believes the population has seriously decreased. I saw large tracts of land which I had known as waste and jungle in 1863-64 taken into cultivation, reclaimed, and even studded with hamlets by 1870; I have seen the town of Bindkee (the great grain mart of the district) grow in size and importance year by year, till it now ranks second only to Cawnpore in that part of the Doab.

6. Mr. White says—"The decrease in the town population is explained by the decadence of such towns as Bindkee, and the rise of Cawnpore." He apparently couples these two alleged facts as cause and effect; but I deny the assumed effect, viz., the decadence of Bindkee, and I maintain that the rise of Cawnpore, so far from being any reason for the decadence of Bindkee, has been the constant cause of its increase and prosperity.

7. Bindkee is now the meeting place of all the Bundelkhand fairies and cotton-carriers on their way to Cawnpore. They sell what they can at Bindkee, and all that portion of their goods which is destined for down country is sold there and despatched from the Mobhar Railway Station, which is only 5 miles from Bindkee; the rest they take on to Cawnpore, and thence it finds its way up country. Bindkee is also a great cattle-mart, where the buyers and sellers of the Doab and of Bundelkhand meet and exchange their respective breeds.

8. I think if Mr. Plowden will refer to the Tehseldar of Kuliapore for a return of the value of goods and animals sold at Bindkee during the past year, and to the East Indian Railway for a report on the amount of goods despatched from the Mobhar Station, that he will not find much cause to believe in the "decadence of Bindkee." If it be a reality, it has only become so since Mr. White assumed charge of this portion of the district; for the town certainly showed no signs of any falling off in its trade or prosperity when last I saw it in February, 1871.

9. Mr. White having accounted for the falling off in the town population in the above manner, admits that he cannot account for the decrease in the rural population except on the ground that the settlement is a heavy one. I am compelled to disagree in toto with Mr. White as to the settlement being the cause of the decrease, if there

be any,—for if he refers to the old settlement of 1841, it is very extraordinary that its ill effects should only have begun to be felt just as it verged on expiry, the district having prospered under it for 30 years up to that time; while if he refers to the new settlement, I do not see how it can have caused emigration, when it has not as yet come into effect.

10. I also fail to understand what Mr. White means by the "cultivating classes being below the mark in numbers in the adjoining pergunnah of Ruttehpore." Does he mean that they do not maintain there the proportion which they ordinarily bear to the non-cultivating classes, or that they are deficient in actual numbers in proportion to the area of the pergunnah? In either case the figures fail to bear him out, and the distance of the town of Ruttehpore, with 20,000 non-cultivating inhabitants in a pergunnah whose total population is only 108,000, may perhaps be quite sufficient cause to account for the excess in Ruttehpore over other pergunnahs of the non-agriculturists above the agriculturists. It is, in fact, the non-agriculturists who are in excess, and not the agriculturists who are deficient. The proportions in the six tehssees were in 1865:—

<i>Agriculturists. Non-agriculturists. Proportion.</i>			
Ruttehpore,	74*	95	$\frac{10}{7}$ to 1
Ghazeehpore,	51	40	$1\frac{3}{10}$ " 1
Khaga,	59	59	1 " 1
Khabheroo,	56	29	$1\frac{9}{10}$ " 1
Kalianpore,	65	58	$1\frac{2}{3}$ " 1
Korah,	50	46	$1\frac{1}{10}$ " 1

Thus the excess of non-agriculturists over agriculturists in Ruttehpore is only one-third greater than it is in Khaga, which has no large town in it at all, and only four-tenths greater than it is in Korah. The proportion of agriculturists per square acre is as follows:—

Tehsee.			
Agricultural population.			
Square acres.			
Proportion.			
Ruttehpore,	...	74,000	222,368
Ghazeehpore,	...	51,000	170,521
Kalianpore,	...	65,000	174,812
Khaga,	...	59,000	168,676
Khabheroo,	...	56,000	129,265
Korah,	...	50,000	147,720
Total,	...	355,000	10,13,356
			1 to 2.9

so that the proportion is larger in Ruttehpore than in Ghazeehpore, which is a purely agricultural tehssee, and it is only 7 smaller than the average of the whole district.

11. After thus assigning for the decrease two reasons which appear to me to have

been too hastily adopted, Mr. White concludes with a suggestion which, by his underlining of the word "may," he evidently wishes to be accepted as the true explanation of the differences in the two Censuses; but which I would beg to characterize as an unequalled for sneer at those who, however faultily they may have done their work in 1865, at any rate strove honestly to do it to the best of their ability; and if Mr. White had been, as Mr. Whalley and myself were, out in camp all through the rains in a cholera season, organizing the bulks, teaching the enumerators (often practically by taking a Census of their village, or part of it, before them), and ourselves compiling the preliminary returns and statistics,—a duty we both of us performed only at the cost of some injury to our health, and of intense discomfort from being under canvas for three months in the rains,—he would be, as I am, indignant at finding a junior in the service, who came to the district seven years afterwards, sneering at our work and questioning the accuracy of our returns, apparently for the sole reason that they differ from those

* These are thousands, the actual numbers being 74,000, 51,000, &c.

prepared under his own supervision. But the ablest supervision is not a good substitute for the performance of the work by oneself; and if Mr. White will state how many villages he himself inspected for Census purposes, how many days he was in camp doing Census work, and what tests he applied to the preliminary and to the final returns, Mr. Plowden may then be able to judge which returns, those of 1865 or those of 1872, are the more likely to be correct; and should there be a serious discrepancy, perhaps some may think that it is because "the figures of the 1872 Census may be untrustworthy."

12. If we compare the results of the previous three Censuses (1848, 1853, and 1865) with those of the Census of 1872, I think we shall see grave reasons to doubt whether the population has decreased in the manner alleged.

-17,071					-17,071				
Difference between 1853 and 1865.					Difference between 1865 and 1872.				

13. We therefore find that Korah, which diminished by only 1,159 in the twelve years from 1853 to 1865, decreased by 5,210 in the seven years 1865 to 1872, a most rapid increase in the rate of decrease, and one which I confess I do not believe in. So Kalianpore is said to have decreased 6,417 in the last seven years, though it only decreased 7,597 in the preceding twelve years.

But the alleged results for Futtbhore are the most astounding; for though it increased by 136 in the former twelve years, it is stated to have decreased by 7,888 in the last seven years; and again Ghazepore, which increased by 2,834 in the former twelve years, has diminished by 1,012 in the last seven years. The increases in Khaga and Khaleroo are about in proportion with the smaller interval between the Censuses, and are probably fairly correct; but the results for the first four tehssees I believe to be entirely unreliable. I know of no reason for such an enormous decrease, and till good reason is shown I shall decline to believe in its existence.

14. The 1848 Census was confessedly very imperfect, and the population was doubt considerably under-estimated, as it could hardly have increased by 168,000 in five years; but be the error whatever it may have been, it is clear that the population in all parts of the district did increase very considerably between 1848 and 1853, i. e., from the seventh to the twelfth year of this very settlement which is alleged to have caused a depopulation between 1865 and 1872. If, however, we compare the results of 1853 with those of 1865, we find that the population decreased by 9,000 in the western pergunnahs in this period, but increased by 3,000 in the central, and by 7,000 in the eastern pergunnahs, or by 10,000 in the whole district. So that from the twelfth to the twenty-fourth year of its currency the settlement seems to have had no bad effect; and in those very pergunnahs (Dhata and Aynash) in which Mr. White attributes the decrease of the agricultural Hindoo population to the severity of the settlement, the total population has risen considerably at every new Census: this could hardly have happened if the settlement had been severe enough to cause emigration.

15. The relative severity of the settlement in the different pergunnahs also tells against Mr. White's argument,—for though the settlement is comparatively light in the eastern pergunnahs, where the population has increased, yet it is also light in Futtehpore and Kalianpore, where it is alleged to have diminished so greatly; whereas in the two tehsheels which are notoriously the most heavily assessed—Korah and Ghazee-pore (those along the Jumna, where there is most barren land)—the population has decreased greatly in the former, and but little in the latter, thus showing conclusively that it is not where the settlement is heaviest that the decrease is greatest.

16. I therefore decline to believe that the settlement (which was reduced by Sir W. Muir and Mr. Thornton) has been the cause of the decrease which may have taken place in the western pergunnahs, but the existence even of which I much doubt. If it is real, it has been more probably caused by emigration from the western to the eastern pergunnahs, where the land is much richer, the amount of barren land very small, and the market for produce ever increasing, owing to the rising importance of Allahabad.

A. C. TUPP,

Sub-Judge and Assistant Superintendent.

B A N D A.

No. 872, dated the 15th October, 1873.

1. That I consider that the number of the population having been reduced by 4 per cent. as compared with 1865 can be accounted for, I shall take the tehsels in the order in which the decrease is greatest.

2. *Kirree*.—The decrease is 12·4 per cent as compared with 1865. This is accounted for by 34 miles of railway (the Jubbulpore line) having been under construction in 1865, and to the quantity of labour employed all along the line,—most of the labour coming from the Rewah territory. The demand for the labour ceased on the completion of the railway in 1868.

3. The same remarks apply to Tehseel Mow, where the decrease is 6·8 per cent., and in which 15 miles of railway were under construction in 1865.

4. In the Pailani Tehseel the decrease as compared with 1865 has been 5·1 per cent. This is attributable to two causes,—the number of people collected for marriages in 1865, and the number of people absent at the Magh Mela in 1872.

5. Absence at the Magh Mela and at Chitrkote in the Native States near Kirwee, where fairs are constantly being held, accounts for the decrease in the Tehseels of Laberoo, Kamasin, as, well as to a certain extent, of a decrease in Mow and Kirwee, whence people can now easily get to Allahabad by the railway, which they could not in 1865.

6. So much for the particular causes. There are however general causes.

(a) I would put forward my opinion that the Census of 1872 was much more accurate than that of 1865, which was nominal only as regards the heads of houses to that in 1865,—the totals were as often as not given by heads of houses; whereas in 1872 they gave the names of each member of the family.

(b) The scarcity in 1869 undoubtedly caused people to migrate.

(c) The increase of Kans grass, which in one village alone is calculated to have reduced the population by 400.

(d) I am inclined to think that in many places children in arms without names may have been omitted in the last Census.

7. The decrease in Mahomedans in Kirwee is, I think, fairly attributable to the absence of native overseers, chuprassies, &c., employed in the Railway Company and the contractors, who were present in 1865, and the absence of their belongings (females).

other explanation. With regard to the decrease in the number of houses, the causes are very apparent. In Buberoo an error of 8½ per cent. has been discovered in the returns of 1872. The tehseldar makes the number of houses in 1871, 20,140 instead of 18,485; but the other 6½ per cent. is not accounted for, except by the statement that the houses of persons who have left the villages have fallen down. The decrease in the number of houses in Kirwee and Mow may, to a certain extent, be accounted for by the railway works having been completed.

With regard to the great decrease in Seonda, I am quite unable to get a satisfactory explanation of it.

The differences in the other pergunnahs are comparatively small, but it is notable that there is a decrease in all.

My own opinion is, that the instructions being more detailed, the enumeration of houses has been more carefully done, and there is always a possibility of different practice in carrying out instructions, and in the retailing of instructions verbally by tehseldars, naib tehseldars and canoongoes.

In testing infantide returns I found that families are always separating and uniting; and in revising registers there was a difference in this way of as much as 15 families, which means as many houses; and when the preliminary returns were made out, I think there was a tendency to double up the number of houses when fathers and sons were said to be living separate when they really were not.

10. In reply to your 10th paragraph, I find that in Banda, Talam, Kirwee, and Budousa, ruined houses and shops were enumerated in 1865, but not in 1872; this of course accounts for a considerable amount of decrease in those pergunnahs.

E. B. THORNHILL,
Collector.

A L L A H A B A D.

No. 424, dated Allahabad, the 25th July, 1873.

The statement forwarded by you in your docket No. 3010, dated 3rd May, 1873, has been carefully examined.

The following differences alone seem to call for explanation:—

Tehseel.			
Allahabad,	2, 4, 6, 7, 8 and 9.
Munjhunpore,	2, 3, and 11.
Kurrah,	2, 3, 6, 11 and 12.
Sooran,	2, 3, 5, 8, 11 and 12.
Hunda,	2, 3, 5 and 8.
Phoolpore,	2, 5, 10, 11 and 12.
Arail,	2, 3, 5, 8 and 12.
Barrah,	3, 4, 5, 7, 8, 10 and 11.
Khyrghurh,	2 and 3.

The differences in column 2 are owing mainly to the fact that the figures now recorded are those which have been elicited from the records of the present settlement. The care with which they have been prepared has brought to light many errors in the old rough measurements. Much land also that before lay fallow has been taken up and brought under cultivation in each tehsel.

Column 3.—Everywhere, except in Allahabad, there has been an appreciable decrease in houses. This is most marked in the Tehseels of Munjhpore, Kurrah, Barah, and Khytagurh. In the two latter there is a very marked decrease in population, and it is not unlikely therefore that the decrease in houses is the natural result of the decrease of inhabitants. In Kurrah and Munjhpore the rains of 1871 caused the most marked desolation, and converted many mud houses into mere ruinous heaps. To this day the traces of it have not been effaced.

In column 4, the large increase in Allahabad may be ascribed to the fact that the Census was taken in the days of the Magh Mela. This fact is especially resorted to by Hindoo widows, and hence the increase in column 6 is more marked than that in column 5. The Tehseel of Barrah shows a marked decrease in males, and a slighter one in females. The population of this tehseel is pre-eminently poor, and large numbers of the lower classes have drifted elsewhere in search of employment. The stone masonry work in Allahabad has been an especial attraction, and accordingly we find the decrease is entirely on the Hindoo side.

The columns 5 for males in Arai, Barrah, Soron, Hundia and Phoolpore, show decrease. The men of these parts are said to have gone in large numbers to labour on the works near the river Soane. Cholera, too, had been especially virulent in these parts during the hot and rainy months prior to the taking of the Census. The city of Allahabad had also no doubt drawn from its subordinate tehseels pilgrims to the fair. The increase of females in Allahabad has been explained above, that for Kurrah can only be accounted for on the supposition that the Census in 1865 was incorrect, and that many women then escaped numbering.

The increase of Hindoos in Allahabad and decrease in Barrah has been explained. Soron, Hundia and Arai show a large decrease in Hindoo males, and I can give no further explanation than that offered for column 5.

The increase of Mahomedan males in Barrah is owing to a large influx of Mahomedans to conduct settlement operations, and is only temporary. No special cause can be assigned for the differences in Mahomedan females in Arai, Kurrah, and Phoolpore.

G. E. KNOX,

Asst. Collr. and Magistrate.

H U M E R P O R E.

No. 41, dated Camp Moudha, the 9th March, 1873.

1. The first and principal difference in the two Censuses noted by you is the very large increase in the number of the Mussulman population as compared with the Hindoo. This is accounted for by the fact that a very considerable number of persons who were, in the Census of 1872, counted as Mussulmans, *e. g.*, rungrazes (dyers), behnas (carders of cotton), joolahas, &c., were in 1865 numbered as Hindoos. It appears that in 1865 the principal, if not the only, divisions of Mussulmans were Sheikh, Syud, Pattan and Mogul, under none of which do these very low classes of Mussulmans come; indeed their manners and customs are exactly similar to those of Hindoos, and they differ from them only in this, that they bury their dead.

2. The next material difference is in the number of houses recorded in the two Censuses. Your suggestion that the difference was probably owing to para. 3 of the Sudder Board's instructions to enumerators is found on inquiry to be the fact, and this will account for a very large portion of the difference; but I would assign as other causes the greater care that was taken in the Census of 1872; and also the effects of the scarcity of 1868-1869, which impoverished the people generally, and thus rendered them unable to repair the houses which they formerly occupied, but which had tumbled down. The difference in Pergunnah Moudha is striking, as you observe, but except these causes I fail to find any other, though, happening to be at Moudha itself, I have endeavoured to discover some other cause from the tehseel officials.

3. The disproportion between males and females among the Mussulman population,—Pergunnahs Aloudha and Raath showing a considerable excess. In the case of Raath there is a special cause for this. Raath Khans contains by far the great majority of Mussulmans in that Pergunnah, and on the very day of the Census of 1865 there happened to be a local exhibition at Raath. On such occasions of course a larger amount of males would be present than females. It is a matter of notoriety that in Raath the females exceed in number the males among the Mussulmans. In the case of Pergunnah Aloudha, however, I can again find no special cause for the difference, which however in this particular is not very striking,—males being deficient only 1·3 per cent. The Mussulman men of the Pergunnah to a considerable extent take service elsewhere (especially as syces), but this was nearly, if not quite, as much the case in 1865 as in 1872, though the scarcity of 1868-69 may perhaps have driven some more men abroad in quest of service.

4. Decrease in the population generally in Tebseels Moudha, Raath, and Punnawee, and increase in Humeerpore, Jelalpore and Mahoba. These differences are apparently not considered very striking by you, but for them I can assign no cause but the greater care that was taken in the preparation and testing of the Census of 1872, the returns of which I should be disposed to rely on rather than on those of 1865. Neither Census was probably accurate, though both were approximately so, and some margin must be allowed for the greater or less attention paid to the subject by particular tehseldars, though they all received the same orders.

W. T. MARTIN,

In charge of Census, District Humeerpore.

J O U R N A L .

Memorandum explaining the differences of Population and Houses between the Census of 1865 and 1872.

J O U R N A L .

Houses.—The decrease, 2,572, is owing to the late flood of the rivers Goomtee and Sae in September 1871.

Population.—The decrease in both sexes is owing to the failure of crops in 1869-70-71, which compelled the people to leave their houses in search of livelihood; also, after the flood cholera had broken out, and a considerable number of people fell victims to it.

<i>Males.</i>		<i>Females.</i>	
1872,	131,830	1872,	113,120
1865,	141,267	1865,	118,438
—9,437		—5,318	
1872,	16,099	1872,	15,610
1865,	13,564	1865,	13,905
+2,535		+1,705	

The decrease in Hindus and the increase in Mahomedans is apparently due to the Census being taken with more care in 1872.

M U R R E E N A H O O .

Houses.—The increase, 7,467, is owing to the fact that the people having either domestic quarrels or finding their houses too small have built new ones.

Population.—The increase in Mahomedans is apparent, for the Census of 1872 has been taken more carefully than that of 1865.

КНОТЯНЪ.

The differences in the respective columns are nominal, and the only reason that can be assigned is, that the present Census has been more carefully taken than the former one.

КЕРАКУТ.

Houses.—The decrease, 509, is owing to the late flood.

Population.—The columns 4, 5, 6, 7, 8 and 9, do not require any explanation. The cause of decrease in Malahomedan population is on account of the inaccuracy of the former Census.

МІУСІНЕСІНУН.

Houses.—The decrease, 1,608, is attributed to the late flood.

Other columns do not require any explanation.

R. WALT,

Officiating Collector.

A Z I M G U R H.

No. 446, dated 30th May, 1873.

I HAVE the honour to state as follows:—

1. *Cultivated Area*.—Culturable lands have been brought under cultivation between 1865 and 1872, and as the settlement advances fresh lands are being rapidly brought under cultivation.

2. *Number of Houses*.—The apparent increase in the number of houses is chiefly owing to each household with separate hearth (*choola*) having been counted as one house, where there were several households in one enclosure they were numbered as separate houses. This system was not carefully followed in the Census of 1865, hence the apparently small number of houses shown in that Census.

3. *Total Number of Population*.—Mr. Simson (in whose time the Census was taken) has already explained to you in his memorandums, forwarded with this office dockets marginally noted connected with certain pergunahs, that the population is believed to have been considerably understated in 1865, through an apprehension felt at the time that the Census was intended as the basis of an arms assessment.

4. It will be remembered that the Census in 1865 was taken on a system imitated from the English system; an attempt was made to visit every house in one day, and to make the enumerations all at once.

This system obviously carried with it a considerable risk that the enumeration would fall short of the truth.

5. On the other hand, the Census of 1871-72 was virtually taken three times over. First, there was the preliminary Census through putwars and town officials in November, 1871. Then there was testing process by officers on tour. Lastly, the final enumeration in January, 1872. As the process of 1865 involved risk of omission, so that of 1871-72 involved a like risk of repetitions. To illustrate this, I may state that when I was engaged in testing the enumeration of city Koel (Alygaurh), where I was stationed in January, 1872, two persons actually told me that their names had been thrice entered, and at different towns,—one man, I remember, said he had been at Mathura in November, 1871, at Bindrabun during the testing by a district officer, and finally I spoke to him at Koel on the night of the January enumeration.

These special instances were of course set right. But who is to say how many hundreds, or even thousands, of like cases escaped notice?

6. In view of this, which I look on as a highly probable source of error, and of the opposite source of understatement in the 1865 Census, I confess I have not felt any surprise whatever at the curious apparent results of 1872. I must add that I feel only a very limited confidence in the accuracy of either Census; nor do I see how

anything even approaching trustworthiness could have been attained considering the means at the command of district officials.

E. S. ROBERTSON,

Officiating Collector.

MIRZAPORE.

No. 267, dated the 27th May, 1873.

The population in this district has on the whole declined since the Census of 1865 was taken.

As far as can be ascertained, the causes of this diminution are—

1st.—The great decline in the commercial prosperity of the city of Mirzapore consequent on the opening of direct railway communication between Calcutta on the one hand, Subulpore and Delhi on the other. The importance of Mirzapore as an emporium for goods despatched to it from Calcutta by the river Ganges, for distribution to the markets in the north-west and south, and at which goods were collected from the districts up-country for transmission to Calcutta, has been utterly and for ever destroyed. The merchants who traded here have gone to other centres of business, and those dependent on them have disappeared with them.

2nd.—The scarcity of food in 1868-69, if not so great as to lead to the death of people from want, must indirectly have checked the increase of population, and certainly stimulated emigration to other districts and the colonies.

3rd.—Coincident with the scarcity occurred a severe epidemic of cholera, which probably was more fatal in consequence of the absence of abundant nourishing food.

4th.—The great bulk of the Mahomedan population belonged to the weaver class, which has been largely thrown out of work in consequence of their inability to compete with European manufacturers. Many of them have emigrated to other parts.

The diminution in the number of houses is probably connected with the decrease in the population.

The reason why no area of cultivation was given for Tehseel Chuklia is, that in the form prescribed by the Board there was no column in which it could be shown. The whole tehseel is maffee, the Altnughra of the Maharajah of Benares, and the total area had therefore to be shown in the column for lakhiraj: none of it could be shown amongst malgoozaree or assessed land.

The cultivated area in Chuklia was returned last year as being 60,917 acres. It is on the whole larger than in 1865, cultivation being on the increase in that pergunnah. In the rest of the district the differences between the returns of 1872 and those of 1865 are not due to any material change in the state of affairs in the direction the difference would seem to indicate. There has not been an extension of cultivation in Tehseels Robertsghur, Chunar, and Mirzapore. The returns of 1872 were prepared with great care, and errors which had crept into those of 1865 were corrected. The most important of these was the inclusion of the cultivated area of the Government Doodhlee Kham Estate in the lakhiraj Pergunnah of Singrowlee, to which since its resumption in 1853 it ceased to belong. This area, 24,131 acres, accounts for most of the increase shown in Tehseel Robertsghur. In Tehseel Bundooche the returns of 1873 show a falling off in the area cultivated. The decrease is purely apparent. The area in 1865 was wrongly stated, an error having occurred in converting beegahs into acres, which I myself detected.

C. ROBERTSON,

Officiating Collector.

B E N A R E S.

No. 422, dated Benares, the 11th August, 1873.

1. The points chiefly requiring notice are as follow:—

(a) Houses have increased by 25,000 in Benares, and 2,800 in Chundowlee.

(b) Hindoos decreased by 18,000 in Benares, and increased by 13,000 in Chundowlee, and Mohammedans increased by 5,000 in Benares.

(c) Decrease in Hindoos chiefly in males.

(d) Increase in Mohammedans chiefly in females.

(e) Cultivated area in Chundowlee 3,400 acres less than in 1865.

As to No. 1, I am informed that the same method of enumeration of houses was practised as in 1865. The increase is attributed to the continually increasing practice of separation among Hindoo families. It seems to be admitted on all hands that the old custom of having but one "chola" for all the members of the family is fast dying out. I cannot believe, however, that this is sufficient to account for the very large increase in the Benares pergunnah. I think there must have been some difference in the method of enumeration; but I have been unable to discover that such was actually the case.

2. The causes for the decrease in Hindoos have been given in Mr. Sinkinson's letter No. 135A, dated 27th February, 1873. I am unable to add anything of value to the explanation there given. I can assign no satisfactory reason for the increase of Mohammedans. It is said by some that a decided revivalism of the Mohammedan religion is now going on, and that the increase is to be attributed to proselytism. If this is so, it seems strange that the increase should be more in females than males.

3. The decrease in Hindoos being chiefly in males is easily understood, if it is the fact that the decrease is caused by emigration and by the attraction of railway works.

4. Of this I can give no explanation.

5. This is due to an error in the Census papers. The cultivated area was entered from the jumabadrees at 197,810 acres. Subsequent enquiries for the purposes of the acreage tax have shown it to be really 211,913 acres, or, deducting 9,660 acres of lakhtay land, 202,253 acres, which is the correct amount. The returns should have shown an increase of some 1,600 acres instead of a decrease of 3,400.

6. In conclusion, I must explain that I have been unable to draw upon the local knowledge referred to in your letter under reply, for the simple reason that, with the exception of the two talukdars, every one who took any part in taking the Census has left the district. I have been in Benares four months, my Joint Magistrate six months; my two Assistants have been—one nine months, the other 18 months in the country. Under these circumstances, I beg to be excused if the information I have been able to furnish is somewhat unsatisfactory. Enclosure of his letter under reply is returned.

W. KAYE,

Offg. Collector.

G H A Z E P O R E .

No. 333, dated Ghazepore, the 1st August, 1873.

2. *Area*.—The cultivated area of 1872, as set out in the statement received, is incorrect throughout. It seems to have been taken from the statement submitted to the Board on 18th August, 1871, in reply to their Circular B. E. E., of 10th idem. The correct figures are shown in the return submitted with this office No. 437, dated 24th October, 1872, as follows:—

District of Ghazepore,
Tehseel of (1) Ghazepore,
" (2) Bulhah,
" (3) Russarah,
" (4) Mohanabad,
" (5) Zamanah,
" (6) Sydpore,
	1,003,272	97,873
	170,966	268,619
	138,886	136,051
	190,877	97,873

Cultivated area in acres.

These errors affect of course the percentages. There is an increase throughout in the cultivated area.

3. *Number of houses.*—This has largely decreased. The cause appears to have been twofold. In the returns for 1865 both occupied and unoccupied houses appear to have been entered, whereas the returns for 1872 included those only which were occupied; and in the rainy season of 1871 an unusual number of houses fell, especially in the Bulliah and Zamaniah Tehsees.

4. *Population.*—The total population of the district appears to have decreased slightly, thus:—

1865,	...	1,342,234
1872,	...	1,345,401

being a total decrease of 0·2 per cent; but if the returns are correct, the decrease is entirely in males, while in females there is an increase. Had this supposed increase been confined to Hindoo females, one might have supposed that the str made about infanticide had something to do with increased returns; but this is not the case—Mussulman females have also increased. The discrepancy is therefore, to me, a mystery.

The decrease has occurred in—

Tehsees Ghazee pore,	5 per cent.
" Mohamadabad,	3·5 "
" Zamaniah,	2·5 "

The decrease may be partly due to increased accuracy in returns; but in Tehsees Ghazee pore it would seem to be chiefly due to the absorption by the Ganges of three villages, a few of the inhabitants of which went to reside in Tehsees Zamaniah, and the rest in the Benares and Shahabad Districts.

5. The total population has increased in—

Tehsees Bulliah,	0·1 per cent.
" Russrah,	14·4 "
" Sydpore,	3·8 "

The large increase in Russrah is noticeable, and affects almost equally both the Hindoos and Mahomedans. The increase in this tehsees of 20·1 per cent. under the head of Mahomedan females is especially remarkable.

The Hindoo population has increased in—

Tehsees Bulliah,	0·5 per cent.
" Russrah,	14·4 "
" Sydpore,	6·8 "

and has decreased in—

Tehsees Ghazee pore,	5·2 per cent.
" Mohamadabad,	3·6 "
" Zamaniah,	2·4 "

The Mahomedan population has increased in Tehsees Russrah only to the extent of 14·8 per cent, and has diminished in—

Tehsees Ghazee pore,	2·8 per cent.
" Bulliah,	5·0 "
" Mohamadabad,	2·7 "
" Zamaniah,	3·7 "
" Sydpore,	23·8 "

The very large decrease (39 per cent) in Mahomedan males in Tehsees Sydpore, accompanied as it is by an increase of 1·0 per cent. in Mahomedan females, is very curious.

6. One uniform method of counting the houses appears to have been followed throughout the district in 1872; but that method, as noticed above, appears to have differed from the one pursued in 1865.

W. DUTHOIT,

Offg. Collector.

APPENDIX F.

Memorandum explaining differences of area as shown in the Census of 1865 and that of 1872 (Abstract).

DETAILED EXPLANATION.

Miles.	Miles.				
		1865,	1872,	...	Decrease,
...	2,227	1872,	2,217	...	10
511	511

Decrease is nominal, and is caused by difference in the two measurements, from which the figures for 1865 and 1872 have been taken,—the latter being the more accurate of the two.

Miles.	Miles.				
		1865,	1872,	...	Increase,
627	1,616	1865,	1,659	...	12
229	229

Increase.

Increase, ... 8,283

Net increase, ... 7,922

Miles.	Miles.				
		1865,	1872,	...	Decrease,
620	2,361	1865,	2,353	...	8
317	317

The Collector explains that the figures for 1872 do not contain the area of the Cantonments—5 miles, 557 acres—which will bring up the figures for 1872 to 2,380 miles 264 acres, leaving a difference to be accounted for of 1 mile 356 acres. This decrease is nominal, and is due to the difference in the measurements from which the figures of 1865 and 1872 have been taken,—the latter being the more accurate of the two.

Miles.	Miles.				
		1865,	1872,	...	Increase,
249	1,908	1865,	1,910	...	1
...

Increase—transfer of a village from Delhi District to Pergunnah Dunkour.

Miles.	Miles.				
		1865,	1872,	...	Increase,
358	1,859	1865,	1,963	...	104
455	455	97

Increase nominal, and is caused by difference in measurements which formed the basis of the entries for 1865 and 1872, and by the omission from the former statement

"The statement of 1865 is founded on the measurement of last Settlement, and is wholly wrong, a large area of barren land having been omitted. The statement of 1872, giving 1,955.49, is correct, and is founded on the Settlement measurement."

NAME.	1865,	1872,	Increase,	Miles.	Acre.
Bijnour,	1,882	179
"	1,902	603
			...	20	421

Increase is nominal, and is due to the difference in the measurements of the 8th and 9th Settlements,—the 1865 figures being taken from the former.

NAME.	1865,	1872,	Decrease,	Miles.	Acre.
Moradabad,	2,160	472
"	2,056	...
			...	401	472

In reply to inquiry the Collector has stated, since the statement in Volume I. has been printed, that his figures for 1872 are not correct, but should be 2,271 miles 582 acres, leaving a net decrease to be accounted for of 188 miles 530 acres.

This he explains is due to the transfer of 179 villages—area 186 miles 213 acres—to the Turaine District, the remaining 2 miles 318 acres is probably due to the difference in measurement, and is nominal, but the Collector has not explained this.

NAME.	1865,	1872,	Increase,	Miles.	Acre.
Budaon,	1,972	537
"	2,004	536
			...	31	639

The Collector explains that the increase is nominal, and is due to greater accuracy in the later measurements, which give the area now shown:—

NAME.	1865,	1872,	Increase,	Miles.	Acre.
Bareilly,	2,372	627
"	2,812	110
			...	439	123

The Collector states, subsequent to the printing of the statements, that the figures for 1872 have not been correctly given by him in the Pilibhet Tehseel, owing to the exclusion of some of the Poonpore jungle grants. Instead of 841 miles 600 acres in Tehseel Pilibhet, he now shows 1,011 miles 600 acres as below:—

NAME.	Printed table taken from Collector's original statement.	Miles.	Acre.	Collector's revised statement.	Miles.	Acre.
Pilibhet,	...	187	...	238	480	...
Jehanabad,	...	186	...	188	300	...
Poonpore,	...	468	600	584	460	...
Total,	...	841	600	1,011	600	...

The real increase therefore is 609 miles 123 acres of which the 549 miles, 556 acres are owing to the transfer of 404 villages (Poonpore) from Shahjehanpore, and 46 miles 579 acres to the difference in measurement, leaving 12 miles 268

The increase is nominal, and is caused by the difference in the former and the present measurements.

	Miles.			
Exawly,	1,631	1865,
"	1,691	1872,
	359	Increase,	...	59

This increase is attributable to inclusion into present maps of all the areas of ravine and oosur lands, which in the last Settlement were omitted, or estimated roughly.

	Miles.			
Elah,	1,401	1865,
"	1,512	1872,
	107	Increase,	...	107

This increase is attributable to alluvion and diluvion, and difference in the two measurements from which the figures of 1865 and 1872 were taken.

	Miles.			
Dalun,	1,546	1865,
"	1,553	1872,
	6	Increase,	...	6

Difference in measurements,	0	183		
Total,	2	198		

Net decrease—41 miles 132 acres.

	Miles.			
Lullupore,	1,947	1865,
"	1,917	1872,
	2	Increase,	...	2

The increase is nominal, owing to the difference in measurements.

	Miles.			
Cawnpore,	2,366	1865,
"	2,336	1872,
	29	Decrease,	...	29

"The increase in this column, as compared with that entered in the former totals, is owing to re-survey under the revision of Settlement. Collector states,—"The increase in this column, as compared with that entered in the former table, is owing to re-survey under the revision of Settlement."

<i>Miles.</i>	1,666	1865,	...	1872,	1,696	...	29	538
<i>Acres.</i>	288	186

This decrease is nominal, and is due to the difference in measurements from which the figures of 1865 and 1872 have been taken,—the latter being the more correct of the two.

<i>Miles.</i>	1,580	1865,	...	1872,	1,585	...	5	211
<i>Acres.</i>	224	435

The increase is owing to the accuracy in

<i>Miles.</i>	5	5	44
<i>Acres.</i>	167	211

The Collector explains that the figures for 1865 are incorrect in regard to Tirotan and Kirwi; that the total of the district should have been 2,955 square miles, instead of 3,030 miles, 89 acres. This will reduce the real difference to 46 miles 429 acres; and Collector explains this is due to differences in measurements, and is nominal.

<i>Miles.</i>	2,764	1865,	...	1872,	2,747	...	17	418
<i>Acres.</i>	608	190

The decrease is nominal, and is due to the difference in measurements from which the figures of 1865 and 1872 have been taken,—the latter being the more correct of the two.

<i>Miles.</i>	2,288	1865,	...	1872,	2,286	...	1	576
